

# Influence of Submerged Aquatic Vegetation on Sediment-Water Nutrient Fluxes

# Previous Activities

Examine SAV influence on water quality, especially dissolved oxygen.

Based on model calibration 1990-2001.

Activity largely completed July 2021.

# Next Steps

- Documentation.
- Move analysis to WIP loads and SAV distribution.
- Quantify SAV effect on nutrient fluxes.  
Compare to other nutrient sources/sinks.

# The Nitrogen Cycle

We quantify and can report out the indicated fluxes (CB1TF, vallisneria).

# Primary Conclusions

SAV diminishes nutrient retention in sediments.

Diminished nutrient retention is equivalent to an increase in loading.

# How to Examine DO?

Consider three years, 1993 – 1995.

Consider four months, June – September.

Take monthly averages for Deep Channel (DW), Deep Water (DW), and Open Water (OW) segments.

Each Year-Month-Segment average is an “occurrence.”

We get from 108 (DC) to 1080 (OW) occurrences.

## Effect of SAV on Deep-Channel DO (WIP Conditions)

SAV results in diminished DO in all cases. Most often by ~0.05 mg/L

Effect of SAV on Deep-Channel Segments

Much longer tail for WIP conditions

Effect of SAV on Deep-Channel DO (WIP Conditions)

## Effect of SAV on DO in Deep-Water Segments

## Effect of SAV on DO in Open-Water Segments (WIP Conditions)

## Average Effect of SAV on DO in Open Water

# Primary Conclusions

SAV diminishes nutrient retention in sediments.

Diminished nutrient retention is equivalent to an increase in loading.

net sav N effect

net sav P effect

# How Significant Are These Loads?

Distributed N Load from Watershed:  $2.09 \times 10^5$  kg/d

Net SAV Effect: 5654 kg/d

Percent SAV Effect: 2.7%

Distributed P Load from Watershed:  $1.26 \times 10^4$  kg/d

Net SAV Effect: 1317 kg/d

Percent SAV Effect: 10.4%

# Conclusions

Full build-out of SAV enhances recycling of nutrients from sediments to water column.

The enhanced recycling results in diminished DO in Deep Channel and Deep Water.

The enhanced recycling is equivalent to 2.7% of watershed N load, 10.4% of watershed P load.

These numbers result from comparison of build-out to no SAV conditions. To quantify marginal effect of SAV build-out, we should compare build-out conditions to existing conditions.
