

Discussion:

Incorporation of an Environmental Change and Resilience Assessment Framework

Brainstorming and Recommendations

Where/how do we fit assessment and monitoring if no longer an outcome?

A couple different thoughts based on conversation with GIT Chairs:

- Don't want to place the burden on the GITs
 - Still collaborative; we work with the group to narrow focus on certain impacts (ex. flooding, temperature change) that can inform outcome attainability
 - Could help determine additional needs and inform where workgroups should be working
- Joint meetings
 - For example, wetlands as an indicator of resilience would set the tone for a joint meeting between multiple outcomes (land use, wetlands, adaptation, fish habitat)
- Perspective from other GITs
 - Do not leave it up to GITs; they want a separate team to lead the development in collaboration with them
