

Implementing PSC recommendation s:

Temperature/Flow Monitoring Network

PSC Monitoring Review

Objective:

Identify priority monitoring needs for all outcomes in the Watershed Agreement.

PSC Monitoring Review

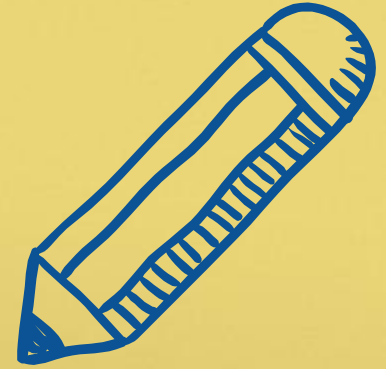

The Climate Monitoring and Assessment Outcome has the need for **development of climate change indicators for monitoring** and assessing ecological and community effects and resilience **related to** tidal bay water temperature change, **stream temperature change**, sea level rise, **flooding**, and extreme heat.

Opportunity

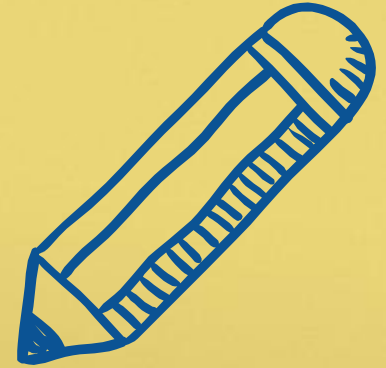

Project Chief for technical design and facilitation support for a gap analyses of the outcome's monitoring network.

- X Work with Workgroup to compile information on data available
- X How jurisdictions/organizations are operating to gather the data
- X What is needed to analyze change over time for parameter(s),
- X Write report to synthesize information

What we need:

- X Confirm **monitoring stream temperature change and flow** is still a priority monitoring need for the outcome.
- X Gauge interest and engagement from workgroup for collaborating with a project chief.
- X Note: Looking into other watershed outcome monitoring needs and potential for phase 2 of implementing network.

Thank You!

Any questions?
