

Addressing Barriers to Local Government Planning for Future Conditions

Overview

- Local governments control nearly all the factors necessary for adaptation to future conditions
- Local government staff (especially in smaller/rural localities) face numerous barriers to acting on future conditions:
 - lack of resources,
 - lack of best practice information,
 - uncertainty on future condition impacts,
 - questionable legal basis for action, and
 - lack of support/understanding by appointed/elected leadership

Overview

- Partnerships with professional organizations/existing trusted training centers provide a basis for information exchange
- Co-production of training with end users (local government staff) is essential

What Adaptation Feels Like at the Local Level

Local Government Guide - 2015

Wetlands Watch conducted a needs assessment of local government staff (n~70) to develop information resources for localities in Virginia. (co-production)

Issues clustered around:

Education - need for it but also too many meetings & studies

Data – national/academic data not of much use

Authority – uncertainty about ability to act

Rural/Urban – much of the info did not apply to rural areas

Need for interdepartmental coordination – not just the planners

Lots of Information \neq Useful Information

Regional Governments Acting Together

Local Government Guide - 2015

PLANNING

- Comprehensive Plan
- Green Infrastructure Plan
- Watershed-Based Planning
- Transportation Planning
- Hazard Mitigation Plan
- Capital Improvement Program

OPEN SPACE PRESERVATION

- Conservation Easement
- Rolling Easement
- Land Use Value Assessment
- Transfer of Development Rights
- Purchase of Development Rights

REGULATORY

- Resilient Zoning
- Floodplain Management
- Building Code
- Freeboard Requirements
- Chesapeake Bay Preservation Act
- MS4 Stormwater Management
- non-MS4 Stormwater Management

CONSTRUCTION

- Property Acquisition and Demolition
- Design Standards
- Structure Elevation
- Hard Armoring
- Soft Armoring
- Beach Replenishment

Local Government Guide - 2015

Capital Improvement Program

The Capital improvement program or plan (CIP) is a growth management tool available to local government to summarize and guide funding and timing of any planned public physical improvements such as construction of infrastructure and public facilities. CIPs must be based on the comprehensive plan, are short-term, detail-oriented, and include cost-estimates (including a life cycle cost estimate). In Virginia, if directed by the governing body, local planning commissions are authorized to develop and revise CIPs every five years. Unless a locality has a capital improvement program, it may not accept proffers for rezonings or special use permits.

Through the project ranking, scheduling, and funding prioritization process, the CIP can facilitate or discourage development, major physical improvements and economic growth in specific areas as designated by the comprehensive plan. Conceivably, a locality can use sea level rise projections to identify areas vulnerable to sea level rise and recurrent flooding in the comprehensive plan and recommend that all CIP projects be located out of those areas then through ranking, scheduling and funding in the CIP, direct infrastructure and public facility projects away from those vulnerable areas to areas identified by the comprehensive plan as suitable for growth and development. The CIP also can prioritize green infrastructure or public facilities projects that preserve open space areas with high ecological value to provide recreational amenities, stormwater management, floodplain management, or resource protection. Through the CIP, existing infrastructure repeatedly flooded or vulnerable to storm surge can be relocated and retrofitted or a locality may discontinue funding for these costly maintenance and repair projects. Localities have also used CIPs to leverage funding for other hazard mitigation measures, such as flood abatement projects and land acquisition. Finally, may use the CIP and the comprehensive plan to direct funds to CIP projects through proffers.

Code of Virginia, § 15.2-2223

The comprehensive plan may include a capital improvements program, a subdivision ordinance, a zoning ordinance and zoning district maps, agricultural and forestal district maps

Code of Virginia, § 15.2-2239

If directed by the governing body, the planning commission must prepare and revise a capital improvements program every five years and the program must be based on the locality's comprehensive plan.

Code of Virginia, § 15.2-2289

No proffer shall be accepted by a locality unless it has adopted a capital improvement program pursuant to § 15.2-2239 or local charter.

- 1: Up to 70 points (Activity 540, Capital Improvement Program (CIP), Manual pg. 540-13): Credit for implementing a Capital Improvement Program or Plan that makes "permanent, structural changes within the drainage system" to reduce flood or maintenance problems.
- 2: Up to 75 points (Activity 430, Protection of Critical Facilities (PCF), pg. 430-21): Credit for regulations that prohibit critical facilities in the 100 and/or 500 year floodplains or require higher standards of protection against flood damage.
- 3: Up to 2,250 points (Activity 520, Acquisition & Relocation of Critical Facilities (bCF), pg. 520-7): Credit for removing critical facilities from the 100 and 500 year floodplains.

Resiliency Bonds are an innovative idea from the RE.bound Program to help finance necessary capital investments, similar to catastrophe bonds. The concept involves managing the financial risk of a natural disaster while generating capital investments for risk-reduction projects. The report on resiliency bonds is available [here](#).

St. Lucie County, FL Coastal Management Element Policy 5.2.1.6

"The county shall consider the most current and credible sea level rise data when planning long term infrastructure and capital improvement expenditures and land use amendments in areas less than 10 feet in elevation."

Section overview, with a priority on applicability for sea level rise adaptation

Local Government Guide - 2015

The [James City County CIP](#) classifies “the acquisition of land for a community facility such as a school, a park, or for green space or conservation purposes” as a Capital Improvement. The CIP funds stormwater projects as a line item, which include the acquisition of property or easements to protect watersheds. This allows the County to fund mitigation and stormwater management projects without a stormwater fee.

Considering sea level rise when siting CIP projects can ensure public infrastructure is not at increased risk to damage. Furthermore, this can have the added benefit of reducing private development in vulnerable areas.

There is the possibility of a legal challenge to certain adaptation actions taken through a Capital Improvement Plan. If a CIP attempts to refuse to maintain or rebuild existing infrastructure that would limit private property access, for example, the locality could potentially be liable for a taking.

The following tools can help local staff identify areas with high ecological values, or that provide valuable ecosystem services, informing the locality as to where new infrastructure and development should not be sited.

Landscape Fragmentation Tool (Digital Coast)	Analyzes land cover fragmentation to identify core regions without fragmentation, which have higher ecological values.
Habitat Priority Planner (Digital Coast)	Inventories specific habitats and conditions, and allows for “what if” scenarios showing the potential impact of new development or habitat restoration.
InVEST (Natural Capital Project)	Includes 18 models for mapping and valuing ecosystem services.

Feedback from one locality underscored the importance of considering sea level rise impact in capital projects. There was concern about the height of a bridge currently under construction and whether it would be affected by sea level rise too quickly to warrant the construction costs. A capital improvement project is a lengthy undertaking, and ensuring it will be accessible through its lifespan helps to ensure public funds are being used efficiently. This could be achieved by establishing standards for useful lifespans of different CIP projects, and requiring that sea-level rise be taken into account over the functional working life of a project. For example, Poquoson, VA has recently installed all new pump stations above the 100-year flood level, using capital investment.

- The Virginia Governor’s Commission recommended that the state discourage the use of public funding on infrastructure in areas highly vulnerable to flooding from sea level rise.
- In Virginia, localities have been required to have a CIP to accept proffers. It should be noted that recent regulatory changes, going into effect July 2016, have affected the proffer system. Click [here](#) for more information.

Issue with Elected and Appointed Leadership

Planning Commissioners and Board of Zoning Appeals members get some basic education (%?) but NO education on future conditions and adaptation.

SO...

We engaged the statewide education program for Planning Commissioners (LUEP) and the state chapter of the American Planning Association.

We proposed an education module on future conditions – mostly flooding resilience to address sea level rise and increased rainfall intensity.

Pilot Modules - 2022

Jan – May 2022 – two training sessions with 40 local government planning commissioners attending

Two locality requests for full briefings:

Harrisonburg – brief full planning commission and economic development department staff

Henrico County – brief city staff on their Climate Action Plan

Wetlands Watch – VA APA Webinars to Date

Climate Change Impacts and Virginia's Responses: Planning for Resiliency Webinar Series

June 27, 2022: Updates to Sea Level Rise and Precipitation Projections, and Incorporating Climate Change into Department of Transportation Design Standards

August 22, 2022: Updates to the Stormwater Management and Erosion & Sediment Control Programs

September 26, 2022: Housing Impacts

October 28, 2022: Updates to the National Flood Insurance Program- Risk Rating 2.0 and the Community Rating System

November 28, 2022: CBPA Regulations and VMRC Tidal Wetlands Guidance

January 23, 2022: Septic/VDH

Next Steps?

Work with other local government professionals “on the front lines” of resilience and adaptation:

- Floodplain Managers – partner with VFMA
- Stormwater Engineers – ASCE-Va Chapter
- Emergency Managers
- Etc.

RELATED LOCAL GOVERNMENT PARTNERSHIPS

CRS Partnership with Local Government

Community Rating System (CRS) can “monetize” open space in the floodplain: more open space, lower flood insurance costs.

CRS is complicated and FEMA regs and processes are cumbersome. Low resource localities are not participating.

Wetlands Watch chairs the local government user group and does “circuit riding” throughout the state helping local governments enroll and improve their ratings.

Collaborative Design Laboratory = Collaboratory

Promoting sustainable buildings in Hampton Roads

STUDENTS DEVELOP AND PRESENT ADAPTATION DESIGNS AND PLANS

To Community and Local Government

Collaboratory = Designs + Future Workforce

Other Partnerships

Land trusts partner with local governments on FEMA-acquired properties.

ESRI Aerials ^

125 ft ————— Deg Min Sec ^ Lon (X): 76° 16' 38.67"W Lat (Y): 36° 45' 22.05"N

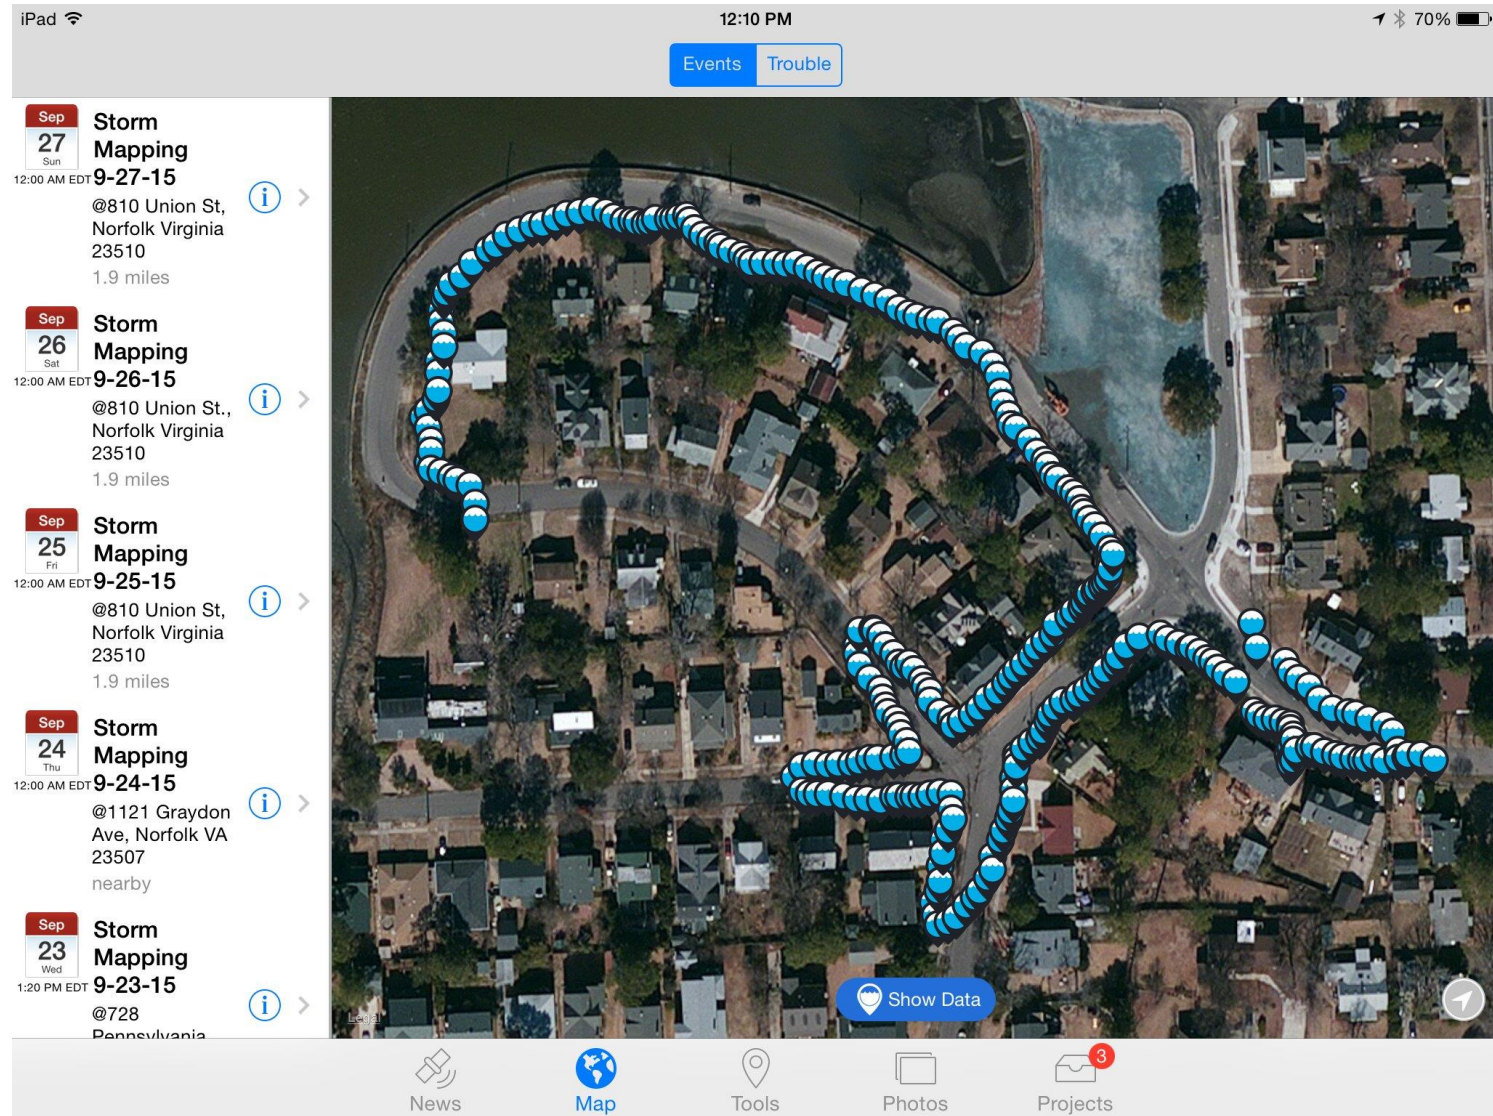

Other Partnerships

Land trusts partner with local governments on FEMA-acquired properties.

Citizen Science flood mapping using a smart phone.

Data Point Collection During “King Tide”

ENDNOTES

Addressing future conditions will ONLY happen through local government action.

Resources produced in concert with the end user have the most utility – listen to local governments on resilience and adaptation issues.

Partnerships with fact-based environmental organizations can extend local government programming (and find resources!)
