

James River CHLa Study – 2012 Summary & 2013 Research

Modeling Quarterly Review

July 24, 2013

http://www.deq.virginia.gov/Programs/Water/WaterQualityInformationTMDLs/WaterQualityStandards/NutrientCriteriaDevelopment.aspx#James_R_CHLa_Study

<http://wp.vcu.edu/jamesriver/>

Virginia Regulations

Existing Before 2005

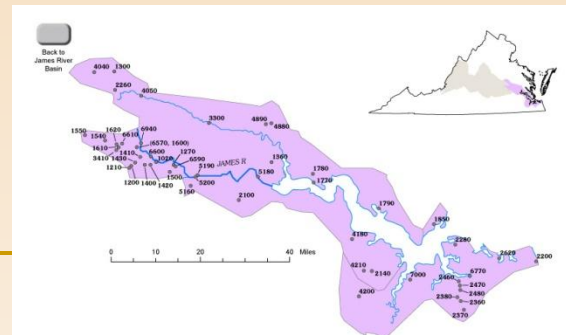

- **Designated Uses** - 9 VAC 25-260-10
“...balanced, indigenous population of aquatic life...”
- **General Criteria** - 9 VAC 25-260-20
“...undesirable or nuisance aquatic plant life...”
- **Nutrient Enriched Waters** - 9 VAC 25-260-330
“...undesirable growths of aquatic plant life in surface waters...”

Chlorophyll Criteria

- Tidal waters eutrophic 
- High and increasing levels of undesirable algae
- Listed as impaired under CWA 303

- Unbalanced community composition
- Attainment of Tributary Strategy Loadings

Virginia Regulations

Adopted in 2005 for All Bay Waters

- **Narrative chlorophyll a criterion** - 9 VAC 25-260-185
“concentrations of chlorophyll-a shall not exceed levels... undesirable... unsuitable... ecologically undesirable water conditions...”

Designated Use	Chlorophyll a μl	James River Segment	Temporal Application
Open Water	10	JMSTF2	March 1 - May 31
	15	JMSTF1	
	15	JMSOH	
	12	JMSMH	
	12	JMSPH	
	15	JMSTF2	July 1 - September 30
	23	JMSTF1	
	22	JMSOH	
	10	JMSMH	
	10	JMSPH	

James River CHLa Study

Re-visit existing numeric CHLa criteria for the James. Are they protective of aquatic life?

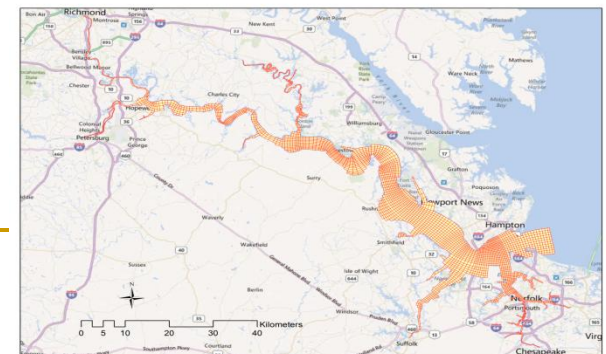

Re-visit the JR TMDL loads with a site-specific water quality – HAB model.

Data Collection:

- When, where, why of algal blooms.
- Effects on water quality and aquatic resources

Modeling: James-specific linkages between nutrient inputs to the estuary and CHLa in the estuary

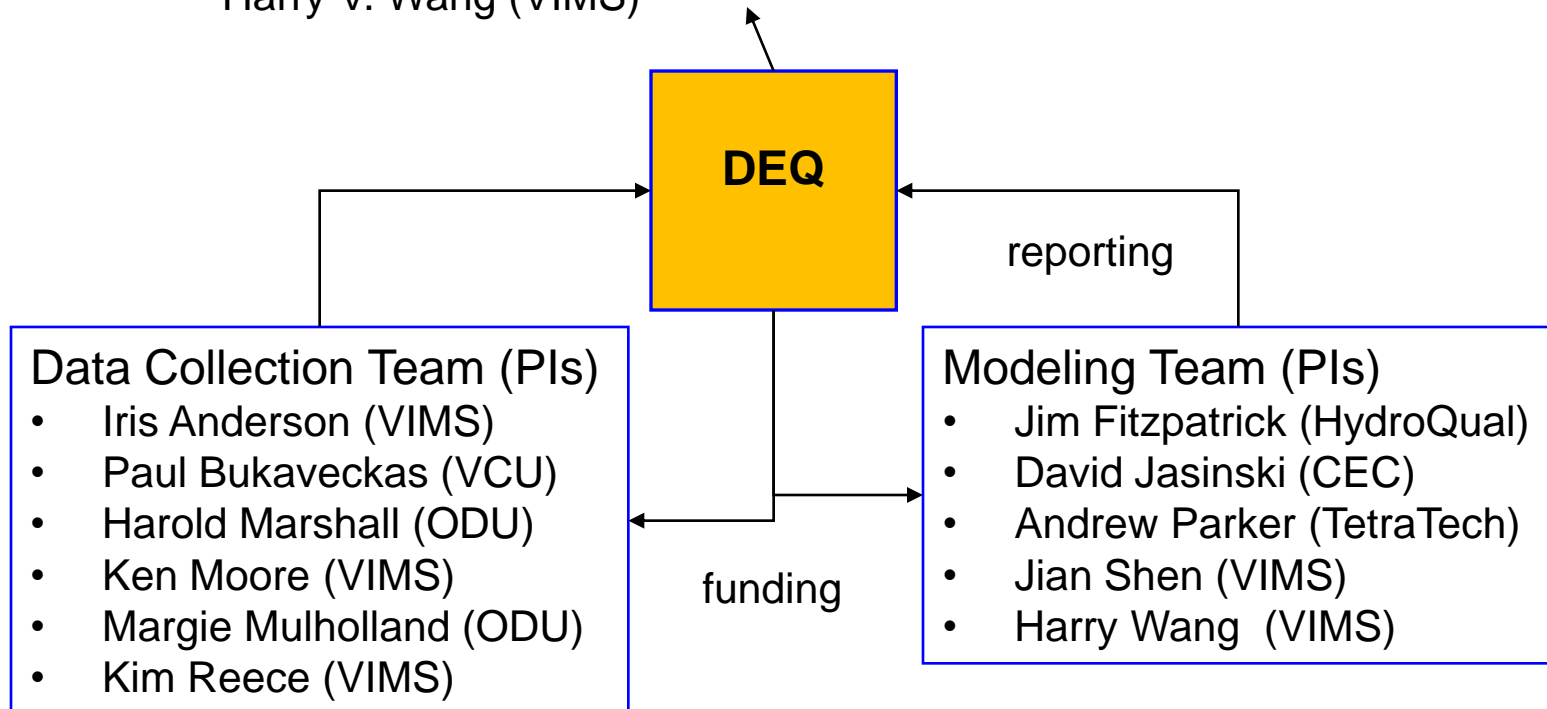

Designated Use	Chlorophyll a μ/l	James River Segment	Temporal Application
Open Water	10	JMSTF2	March 1 - May 31

Project Status

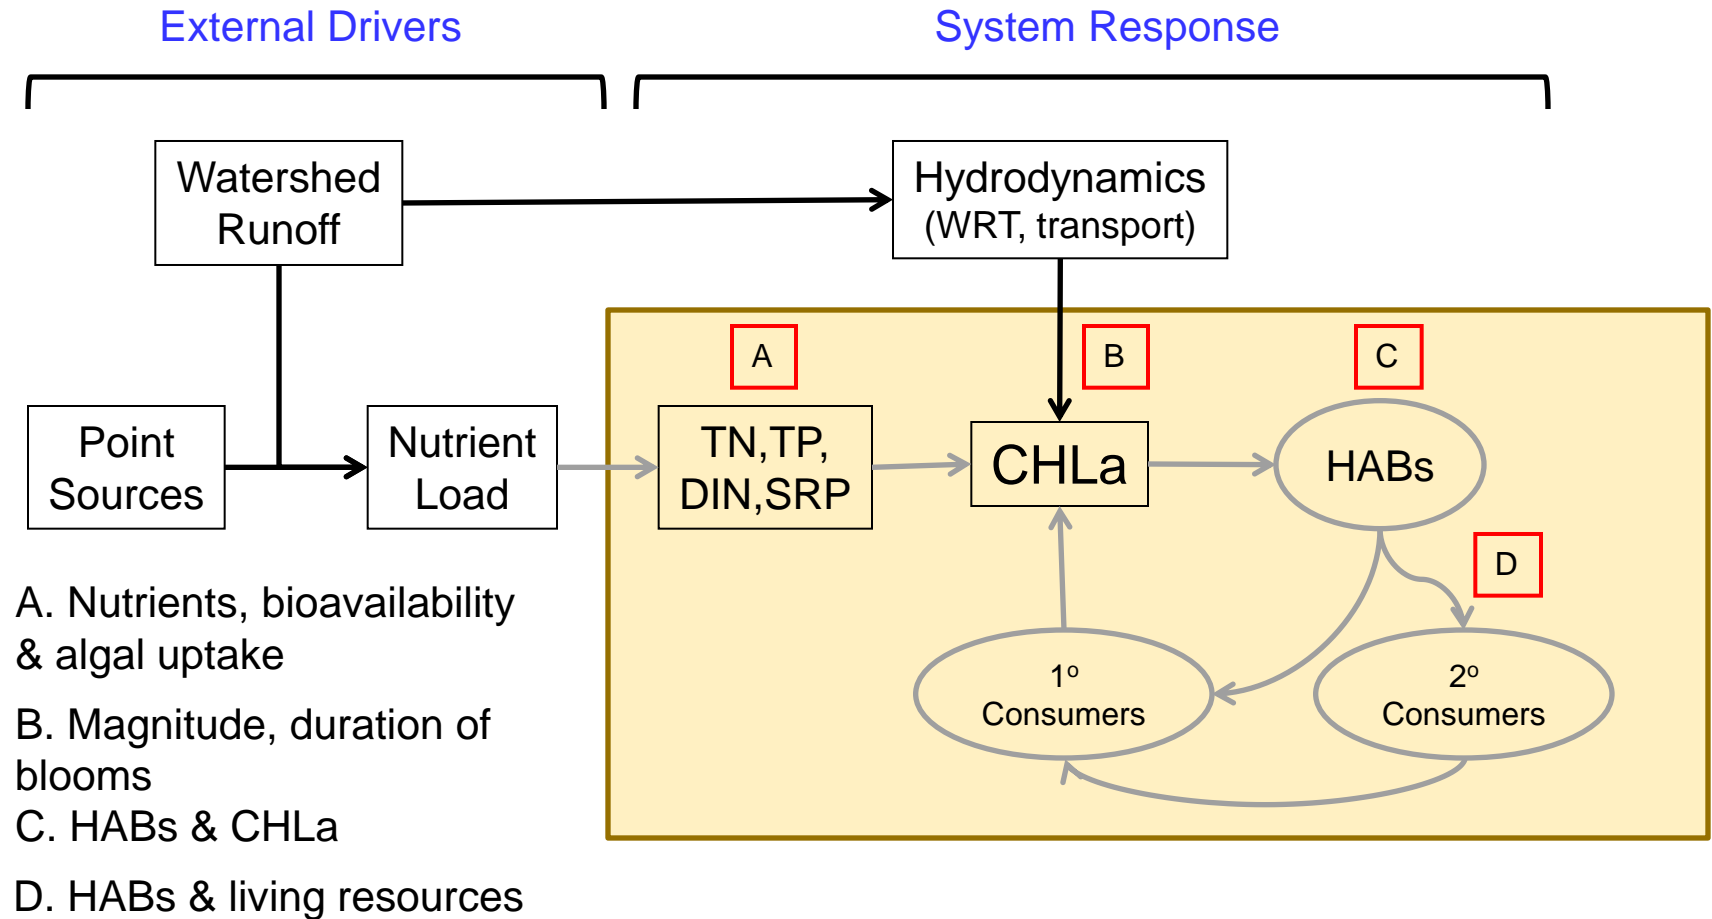

Panal Priorities: Spring 2013

- Evaluate results from 2012 data collection
- Assess 2013 data collection activities
- Evaluate progress in modeling effort

Data Collection and Modeling Framework

Historical changes

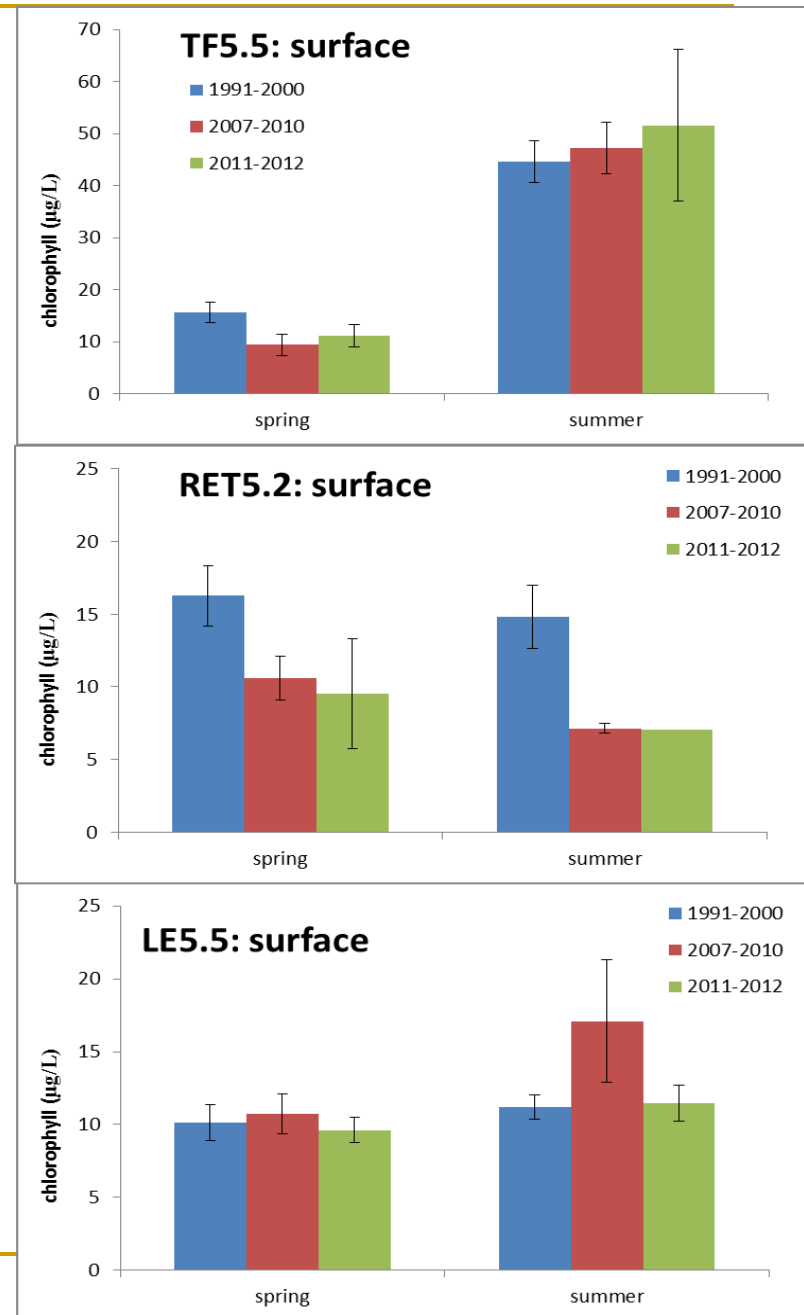

1991-2000 – WQ Model

2007-2010 - HAB

2011-2012 – JR Study

No significant differences between time periods.

Spring (March-May) and summer (July-September) surface chlorophyll concentrations at the three James River phytoplankton monitoring stations during three time periods. No significant differences between time periods.

Bloom duration, frequency, & magnitude

Tidal fresh

- Summer **abundance pulse** (May thru Oct) lasting 26 weeks (183 days) with mean conc. = 39,000 cells/ml for CHLa > 20 µg/L - comprised of diatoms (76%), chlorophytes (16%) and cyanobacteria (6%).

Mesohaline

- Spring **bloom** (Feb & Mar) lasted 5 weeks by the non-HAB dinoflagellate *Heterocapsa triquetra* with conc. > 190,000 cells/ml and CHLa > 300 µg/L.

Polyhaline

- Summer **bloom** (late Jun to mid-Sept) of *Cochlodinium polykrikoides* lasted 13 weeks and reached up to 75,000 cells/ml with CHLa > 300 µg/L. Major biomass and chlorophyll sources were diatoms and chlorophytes during spring and dinoflagellates (70%) and diatoms (25%) during summer

Nutrients, bioavailability & uptake

	P	N	PN	Light
Fisher et al. 1999	0	0	0	11
This study - 2012	0	2	11	12

Results from algal bioassay experiments performed at JMS75 in 1989-1994 (Fisher et al. 1999) and 2012 (this study).

Nutrients, bioavailability & uptake

Urea and NH_4^+ were the dominant forms of N taken up (e.g., ~90% of total N uptake during *Cochlodinium* bloom). These results suggest that wastewater (tf) and regenerated N were important for fueling phytoplankton growth.

Numeric Chlorophyll-a Criteria - 2005

Salinity and Season

Chlorophyll conc (ug/L)

10/15

15/23

15/22

12/10

Upper Tidal Fresh

Lower Tidal Fresh

Oligohaline

Mesohaline

Polyhaline

Tidal James River Chlorophyll-a (ug/l) spring/summer criteria

- balanced community
- attainability

Map labels include: Richmond, Hopewell, Colonial Heights, Petersburg, Williamsburg, York River, Middle River, Wave River, Mobjack Bay, Severn River, York River, Powhatan River, North West Branch, James River, Chesapeake Bay, Hampton, Newport News, Norfolk, Portsmouth, Suffolk, South Branch, Chickahominy River, Goddard Creek, Yarmouth Creek, Cypress Creek, and Laffayette River.

- balanced community
- attainability

Salinity and Season		Chlorophyll conc (ug/L)
Mesohaline	Spring	12-36
	Summer	6-12
Polyhaline	Spring	6-12
	Summer	< 24

CHLa & HABs

- Tidal-fresh: significant relationships between CHLa and Microcystin
- Meso- and poly-haline: significant positive relationship between CHLa and dinoflagellate biomass.

Linking algal blooms & adverse effects on aquatic life

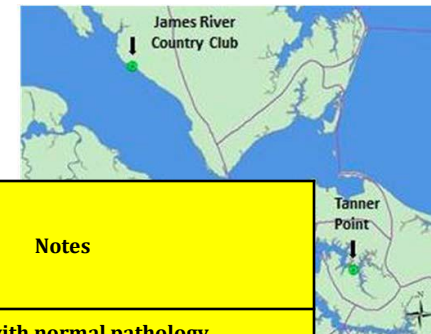

■ Bioassays of *C. polykrikoides* with *Artemia*

- Chl-a > 150 ug/L = 60-100% mortality
- Chl-a < 120 ug/L = < 20% mortality

Bloom Exposure with mature oysters - Oysters exposed to chlorophyll levels spiking above 20 ug/L for 6 or more days exhibited some pathological effects. Most notably, gill erosion was evident in several animals. Following 5 or more days with spikes above 30 ug/L mortalities were observed in samples. **Oysters recovered following several weeks with little to no bloom activity.**

Note: the study was conducted during a time when disease pressures from *Perkinsus marinus* (aka Dermo) were heavy and mortalities cannot be unequivocally attributed to the bloom activity.

collection date (2012)	# oysters sampled (live/dead)	# days since deployment	# days exposed to max >20ug/L	# days exposed to max >30ug/L	# days exposed to max >40ug/L	range of daily mean CHLa levels during exposure	Notes
June 13	5/0	16	0	0	0	3.28 - 12.96	Baseline sample with normal pathology
July 25	15/0	56	6	1	0	2.61 - 16.27	Increased hemocytosis and some gill erosion was observed in all animals
Aug. 8	15/0	70	10	4	0	2.61 - 16.27	2 animals had minor gut epithelial disruption, with metaplasia in one of them. 2 animals had increased hemocytosis in the gills
Aug. 23	13/2	85	10	4	0	1.14 - 16.27	1 animal with gill erosion, 2 animals in the sample were dead
Sept. 13	11/4	106	14	10	2	1.14 - 25.77	Maximum CHLa levels spiked to 103.93 ug/L. One animal was moribund with extensive gill erosion and 4 animals were dead
Nov. 12	13/2	167	17	12	4	0 - 25.77	CHLa monitoring ended 10 days before the collection date and levels had remained low for almost 8 weeks except for 2 days in late October when average levels were 8-9 ug/L. Pathology was normal in 13 animals and 2 animals were dead.

Microcystin in tidal fresh James 2012

- Detected in 104 of 105 water samples during May through October.
 - Detected in 11 of 60 sediment samples during same period.
 - Detected in 254 of 379 (67%) individuals for fish and shellfish. Highest incidence of Microcystin contamination in blue crabs (viscera = 100%; muscle = 64%).
Microcystin in blue crab tissues exceeded WHO safety guidelines in August.
-

HABS & Living Resources

Microcystin concentrations in water and fish tissues.

James River Chl-a Study

Research for 2013

- Algal characterization
 - ❑ Fixed Station in TF
 - ❑ DATAFLOW in OH, MH, PH, ER, LAF
 - ❑ Top-down controls in TF
- Algal Bloom Triggers
 - ❑ Daily and diel monitoring
 - ❑ Storm events
 - ❑ SONE
 - ❑ Nutrients
- Potential Impacts to Aquatic Life
 - ❑ Shellfish
 - ❑ Zooplankton
 - ❑ Fish
 - ❑ Oysters

Dose Response Bioassays

- Toxicity species
 - ❑ *Cochlodinium polykrikoides*
 - ❑ *Prorocentrum minimum*
 - ❑ *Gymnodinium* spp.
 - ❑ *Karlodinium veneficum*
 - ❑ *Microcystis aeruginosa*
- Test organisms
 - ❑ *Crassostrea virginica*
 - ❑ *Bosmina*
 - ❑ *Cyprinodon variegates*
