

# Portfolio effects and species diversity in Chesapeake Bay SAV

Christopher J. Patrick, Kevin E. McCluney, Albert Ruhi, Andrew Gregory,  
John Sabo, and James H. Thorp

SAV Working Group  
February 17, 2021

## > Fundamental Questions

Why do we find some species here, but not there?

What controls the distribution of species and communities (or SAV) in space and time?

# > The world is changing

## Land use change

## Climate change

## Invasive Species

## Habitat Connectivity

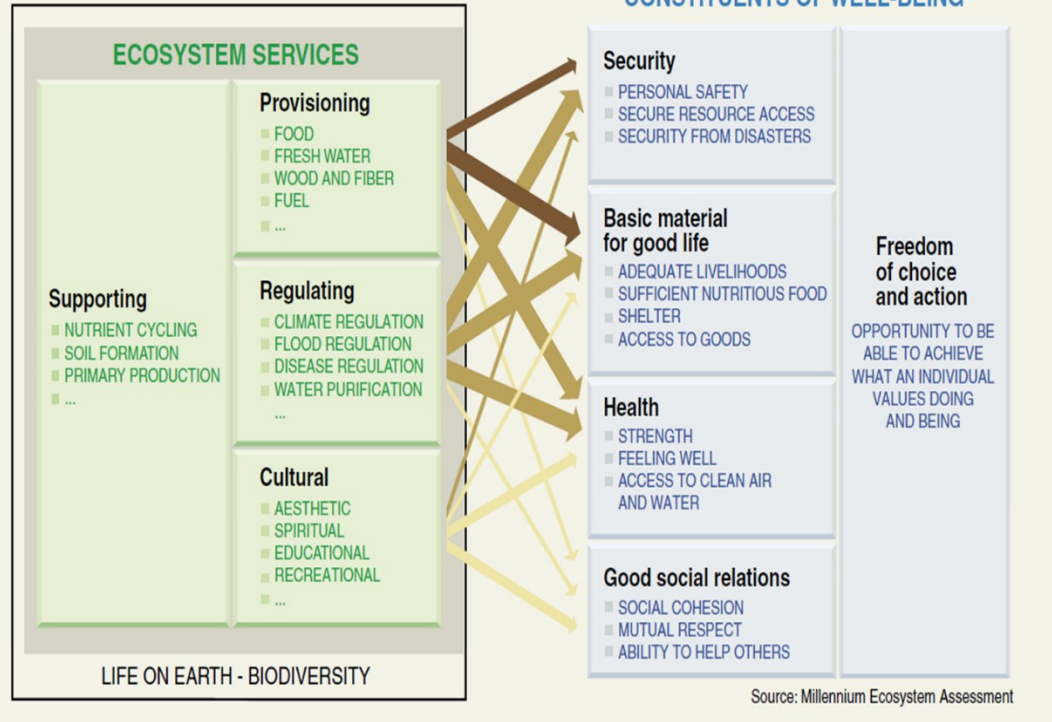

### Fragmentation

### New connections

# > Ecosystem Functions and Services

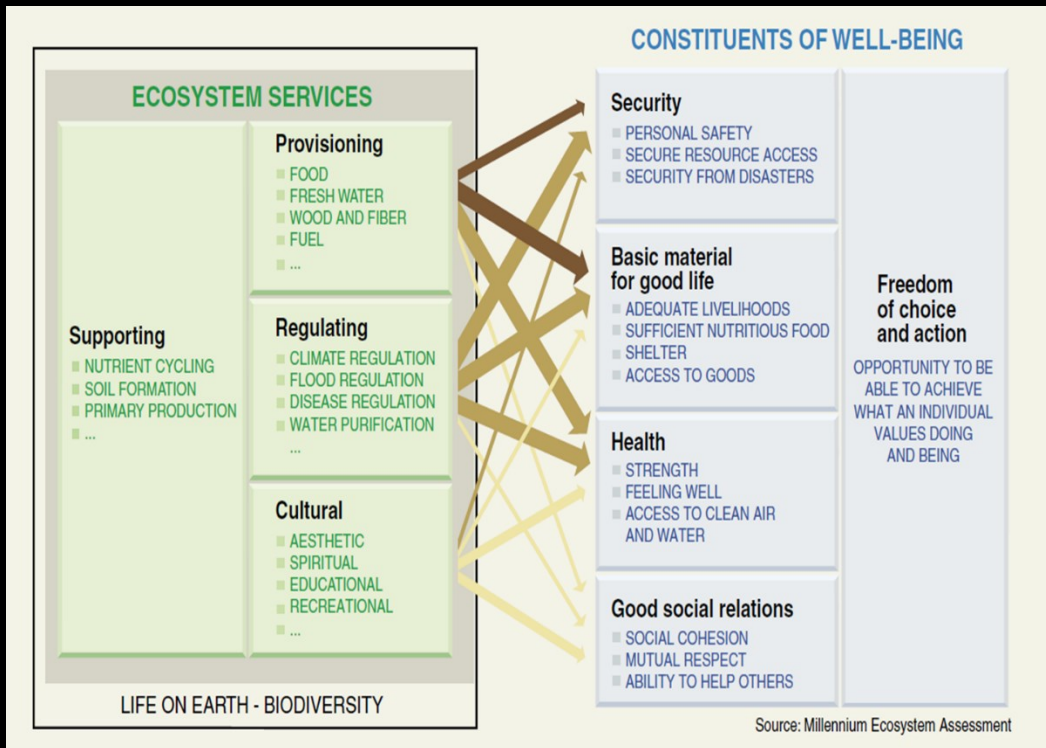

- Submersed aquatic vegetation (**SAV**):
  - Provides habitat
  - Stores carbon
  - Protects shorelines
  - Improves water quality

# > Ecosystem Functions and Services

What is the relationship between biodiversity and ecosystem functioning?

What drives stability in ecosystem functioning?

# > Biodiversity and Ecosystem Functioning

What is the relationship between biodiversity and ecosystem functioning?

Positive relationship between  $\alpha$ -richness and ecosystem functioning

Cardinale et al. 2006. *Nature* 443: 989-992

To make this a tractable question ecologists have looked at the number of species in a mesocosm

OK Did we Solve it?

This suggests that provided we have a minimum number of species in a habitat, no functioning will be lost.

(if you believe that one, let me tell you another one)

# > Biodiversity and Ecosystem Functioning

What is the relationship between biodiversity and ecosystem functioning?

## Assemblage Time Series Reveal Biodiversity Change but Not Systematic Loss

Maria Dornelas,<sup>1\*</sup> Nicholas J. Gotelli,<sup>2</sup> Brian McGill,<sup>3</sup> Hideyasu Shimadzu,<sup>1,4</sup> Faye Moyes,<sup>1</sup> Caya Sievers,<sup>1</sup> Anne E. Magurran<sup>1</sup>

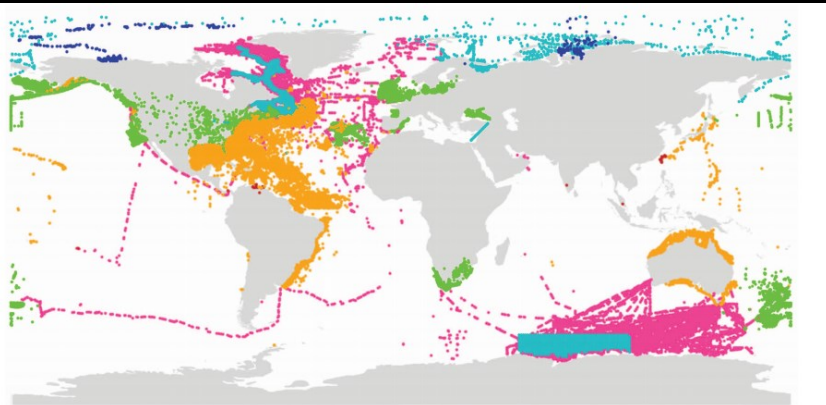

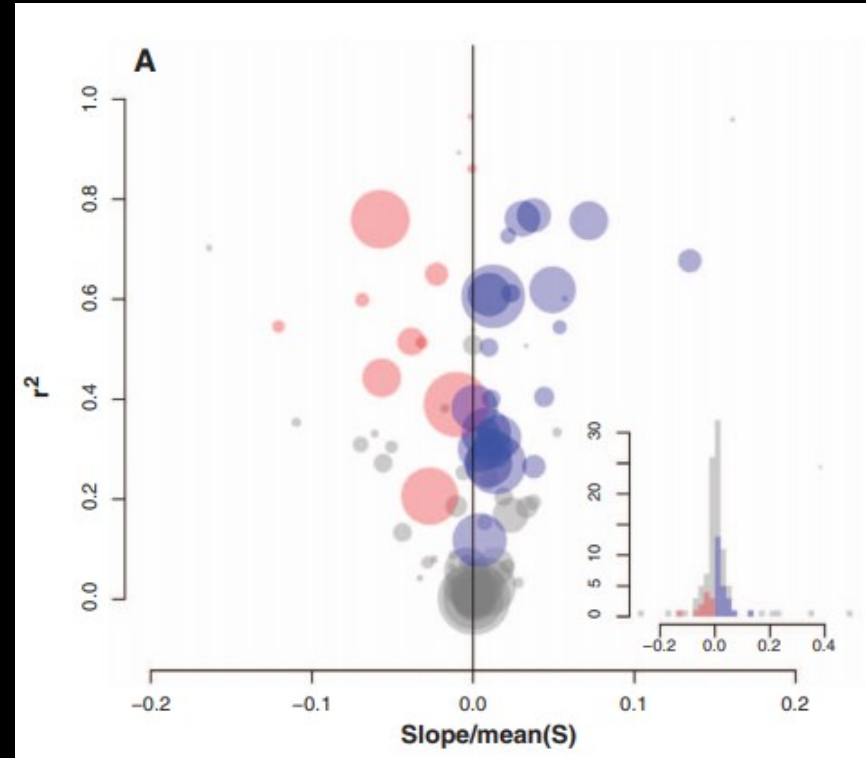

Fig. 1. Distribution of the survey sites included in our analysis. Data sets are color-coded to reflect their climatic region: pink, global; royal blue, polar; turquoise, polar-temperate; green, temperate; gold, temperate-tropical; red, tropical. See table S1 for details and sources of the data sets.

Dornelas et al. 2014. *Science Reports*

Local richness doesn't seem to be changing, despite global extinctions.

So does that mean that global extinctions are not impacting ecosystem functioning?

# > Biodiversity and Ecosystem Functioning

What is the relationship between biodiversity and ecosystem functioning?

## Assemblage Time Series Reveal Biodiversity Change but Not Systematic Loss

Maria Dornelas,<sup>1\*</sup> Nicholas J. Gotelli,<sup>2</sup> Brian McGill,<sup>3</sup> Hideyasu Shimadzu,<sup>1,4</sup> Faye Moyes,<sup>1</sup> Caya Sievers,<sup>1</sup> Anne E. Magurran<sup>1</sup>

NO!

But this shows that it is very difficult to scale the results of small experiments to the **biodiversity change** we're observing in the real world at **landscape scales**

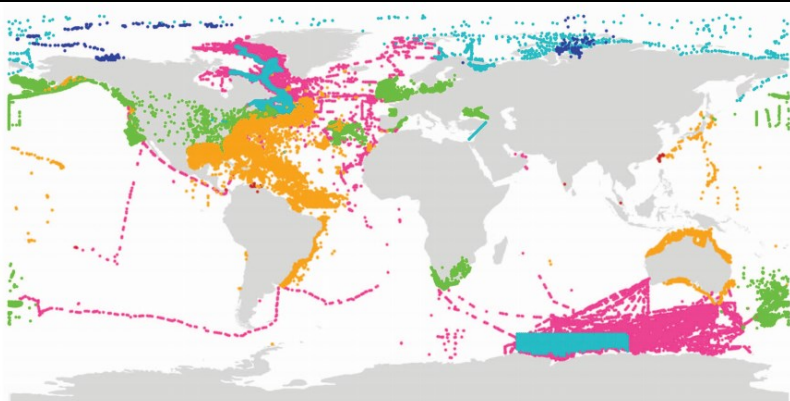

Fig. 1. Distribution of the survey sites included in our analysis. Data sets are color-coded to reflect their climatic region: pink, global; royal blue, polar; turquoise, polar-temperate; green, temperate; gold, temperate-tropical; red, tropical. See table S1 for details and sources of the data sets.

Dornelas et al. 2014. *Science Reports*

Local richness doesn't seem to be changing, despite global extinctions.

So does that mean that global extinctions are not impacting ecosystem functioning?

# > A question of scale

“Perhaps in focusing on local diversity, we have been asking the wrong questions or, perhaps, the right questions on the wrong scale.”

- Robert Ricklefs

*Petersen et al. Ecosystems 1998 1(1): 6–18*

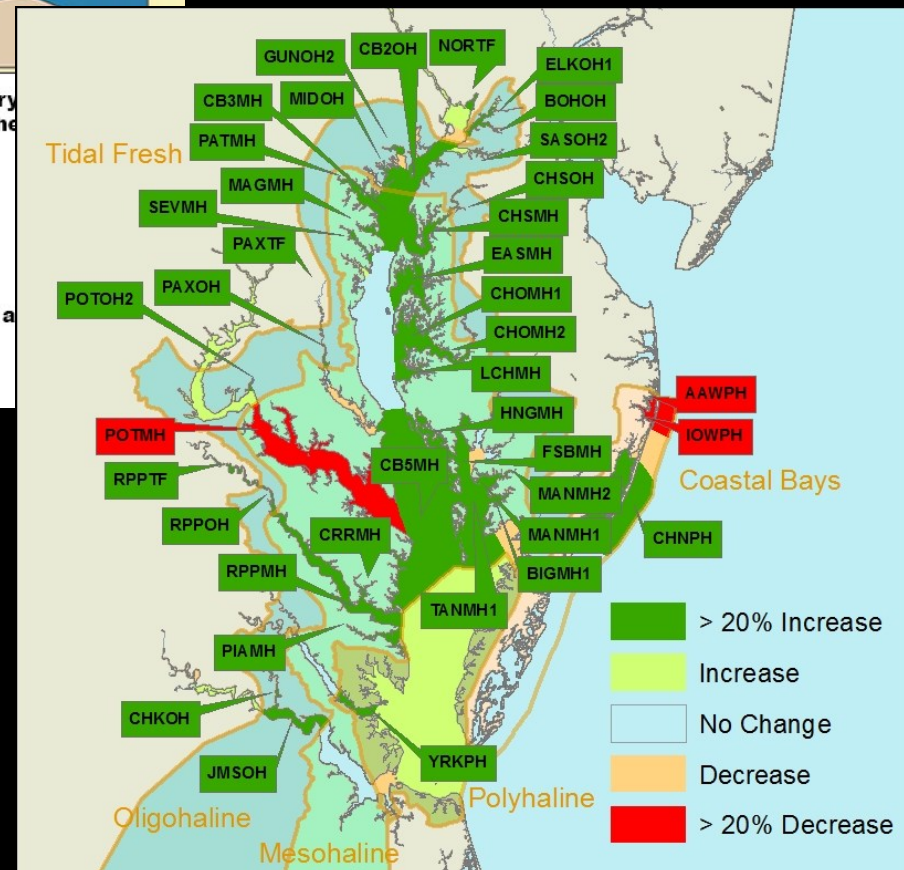

# > SAV in Chesapeake Bay – a Model System

Aerial photographs and digital imagery along the red flight lines flown over the left. Flights require:  
≈ low wind  
≈ minimal cloud cover  
≈ low tide  
≈ low turbidity  
≈ low sun angle

Funded by the EPA, VA DEQ, MD DNR and Coastal Program.

## VIMS SAV Mapping Program

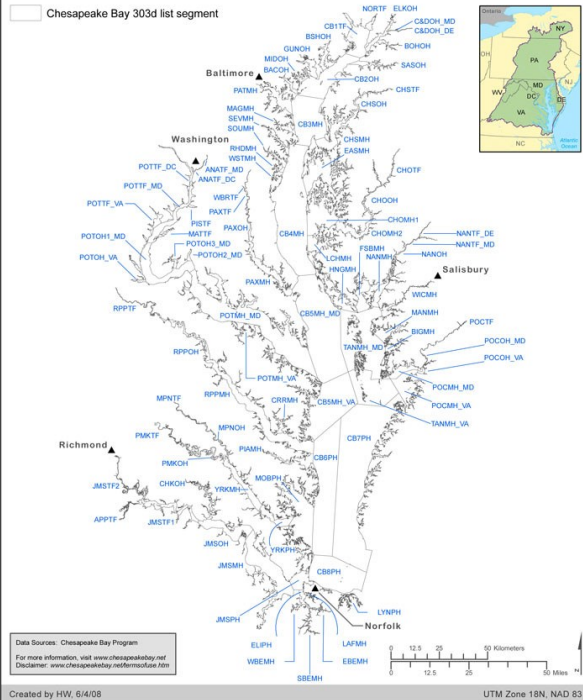

# > Long-term surveys (1984-present)

## Water quality monitoring

### Chesapeake Bay Segmentation Scheme (For 303d listing - 92 segments)

Chesapeake Bay 303d list segment

### Phase 4.3 Model Segments Chesapeake Bay Watershed Model

Chesapeake Bay Watershed  
State Boundary  
Chesapeake Bay  
Phase 4.3 Model Segments

## Chesapeake Bay Watershed Model

# > 23 species of SAV in the Bay

*Freshwater  
grasses*

*Seagrasses*

## > Long-term surveys (1984-present)

30 years of sporadic ground survey data of species identity by river system collected by researchers, state agencies, and trained volunteers

# > Chesapeake Bay: 400 years of change

John Smith

# > Human impacts are on the rise

> Those impacts trickle down...

# > SAV Synthesis

## Long-term nutrient reductions lead to the unprecedented recovery of a temperate coastal region

# > Two separate analyses

## *Subestuary analysis*

## *Bay-wide analysis*

# > What's happening in the watershed?

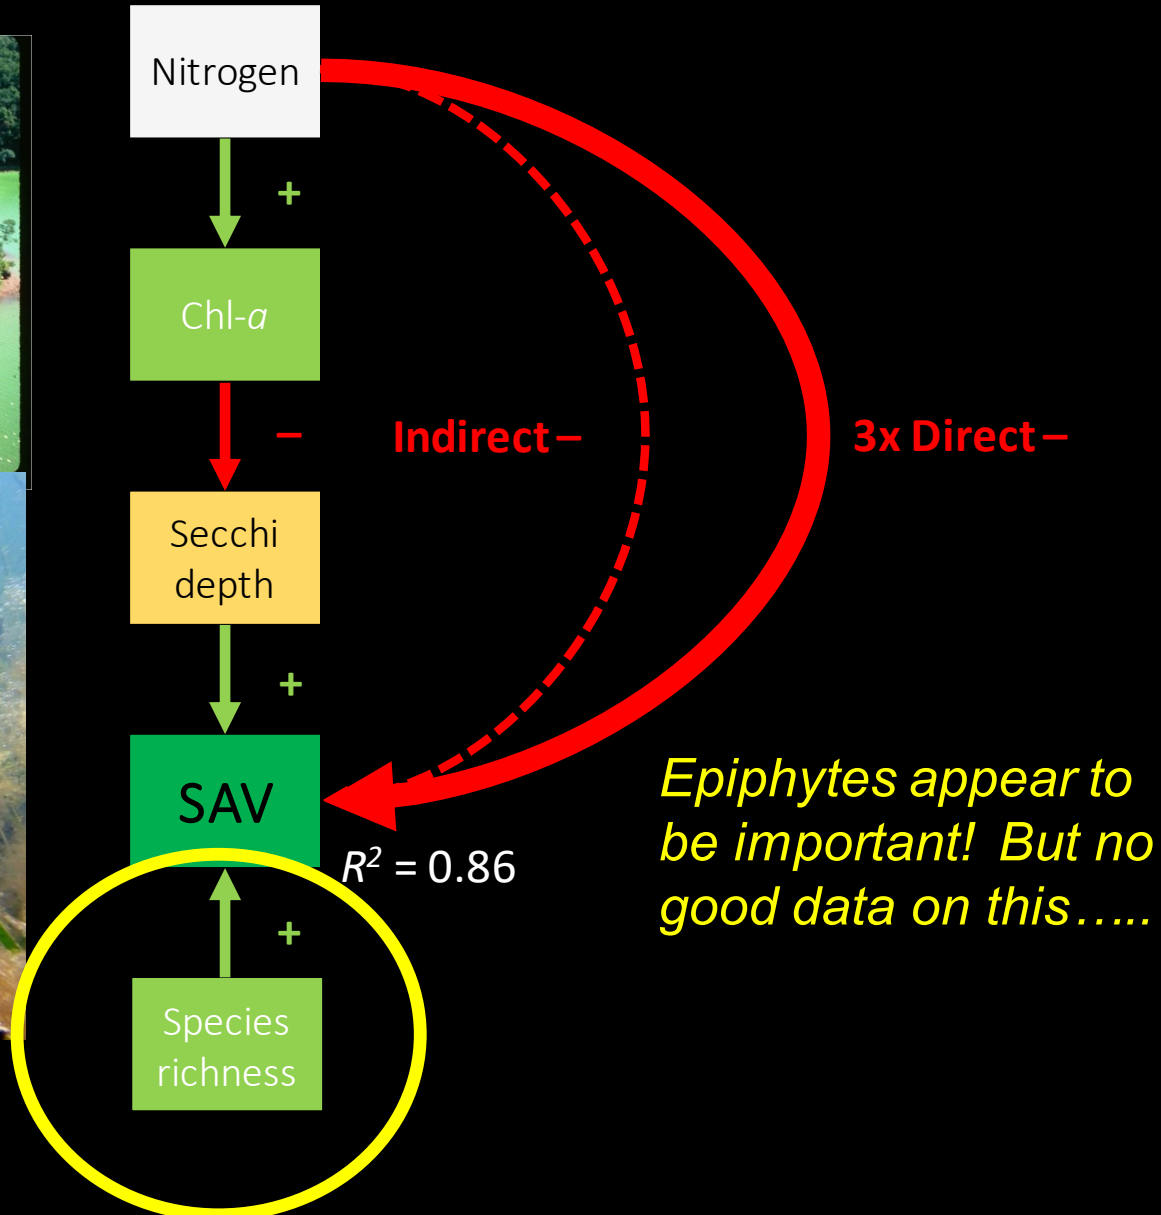

Freshwater  $R^2 = 0.80$   
Mesohaline  $R^2 = 0.72$   
Polyhaline  $R^2 = 0.67$

# > What's happening in the water column?

> What do we still need to understand?

Biodiversity appears to be an important component of the recovery and a predictor of abundance.

Mechanistically how does biodiversity contribute to SAV stability?

# > But first... a few definitions

$\alpha$ -richness – Richness at the scale of the individual habitat

*Scale of most experiments*

$\beta$ -diversity – measure of difference between communities in different habitats

$\gamma$ -richness: scale of regions or even the whole planet

# > Drivers of Ecosystem Functioning

**Portfolio Effects** - Much like with mutual funds, a diverse portfolio of species confers temporal stability

## *Local Diversity*

*Tilman et al. 2006 Nature*

# > Drivers of Ecosystem Functioning

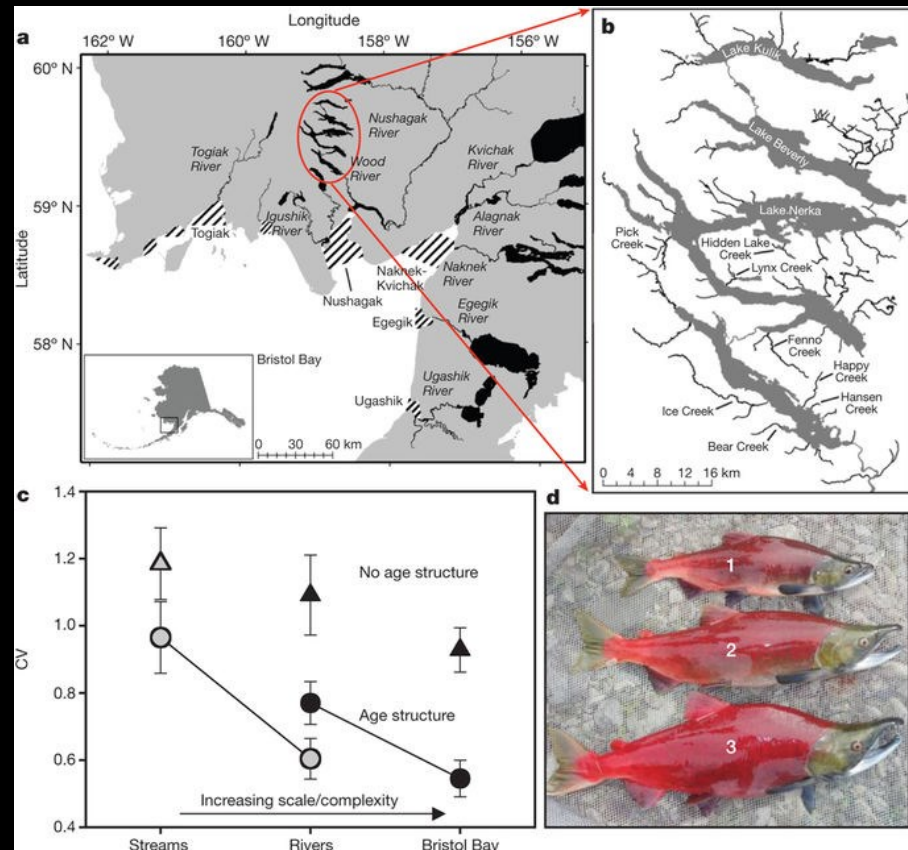

## Portfolio Effects

### Local Diversity

Tilman et al. 2006 Nature

## Population Diversity on Landscapes

Schindler et al. 2010 Nature

## How about portfolio effects for entire communities across landscapes ( $\beta, \gamma$ )?

### Multi-scale biodiversity drives temporal variability in macrosystems

Christopher J Patrick<sup>1\*</sup>, Kevin E McCluney<sup>2</sup>, Albert Ruhi<sup>3</sup>, Andrew Gregory<sup>4</sup>, John Sabo<sup>5</sup>, and James H Thorp<sup>6</sup>

# > Stability in Macrosystems

## Two Major Drivers – Synchrony & Within Site Variability

## > Stability in Macrosystems

**$\beta$ -diversity and  $\gamma$ -richness should increase asynchrony among different communities – reducing variability at the regional ( $\gamma$ ) scale**

# > Basic conceptual model

# > Full conceptual model

## > Intermediate conceptual model

# > Data Sources

## Four decadal datasets

Ground beetles

Stream fish

Seagrass

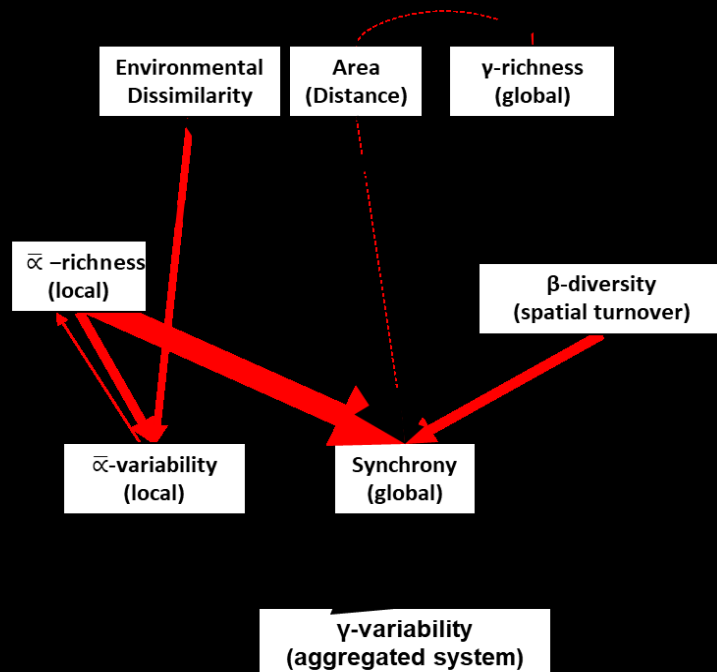

Freshwater  
macrophytes

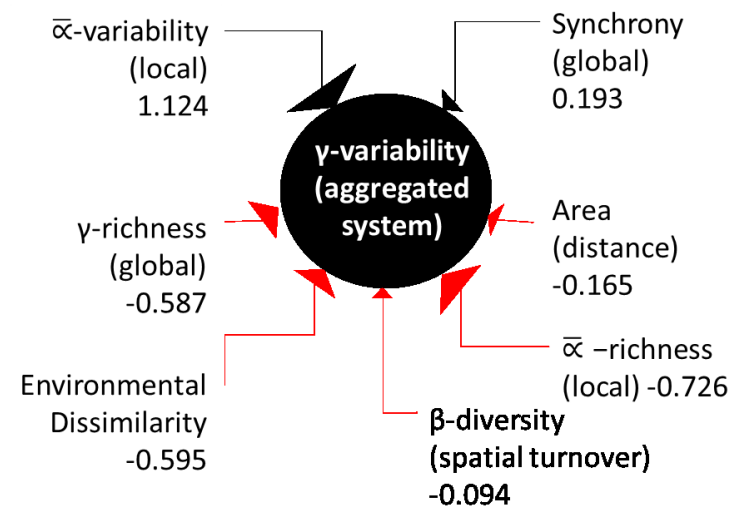

- Spatially explicit replicate samples
- Decadal Time Scales
- Biomass or Abundance Data
- Community Data
- Environmental Covariate Data

# > Complete Model Result

## Total Effects

# > System Specific Model Results

Higher  
Synchrony  
→ Less  
Stability  
Matches  
Predictions

# > Reconciliation

Results, while surprising, perfectly supports the hypothesis.....

Patrick & Weller. 2015 Marine Ecology Progress Series

In the high diversity upper bay, the portfolio effect is operating

In the low diversity lower bay, higher synchrony is indicative of *Zostera marina*, which is much more locally stable than *Ruppia maritima*, and so synchrony is positively related to stability

**The Exception That Proves the Rule**

Unstable  
& Asynchronous

Stable  
& Synchronous

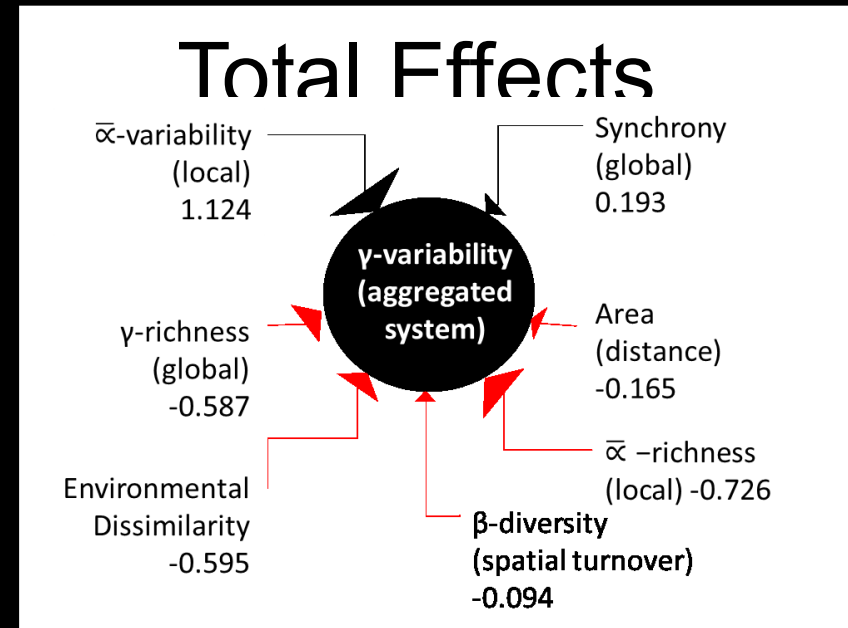

# > Implication - Global

## Regional Biodiversity Confers Regional Stability

Global diversity losses will drive large scale **temporal instability** in ecosystem functioning and delivery of services

Major Implications: topics ranging from impact on harvest based industries to dynamics of disease vectors

**A quantitative argument for the importance of global biodiversity to ecosystem functioning!**

Lots more to tackle on this topic, including testing in more macrosystems and incorporating functional traits....

# > Implication for Chesapeake Bay

This is precisely  
what we predicted  
would happen!

*But things  
weren't so bad  
in the upper  
bay*

TF

OH

MH

PH

*Our biggest  
losses were in  
the Mesohaline*

*It was primarily  
*Ruppia maritima**

## > Implication for Chesapeake Bay

As our dependence on a single species, *Ruppia maritima*, goes up, the potential for instability and catastrophic crashes goes up as well!

## > Future Directions

Our next tasks are to:

- 1) **Theory:** Apply this framework to the other ecosystems and evaluate how common these patterns are.
- 2) **Chesapeake Bay:** Learn more about what controls dynamics in *Ruppia*, lessons for management and planning
- 3) **Chesapeake Bay:** Learn more about mechanistic ways that diversity in the middle and upper bay confer stability
