

CBP Water Quality Goal Implementation Team September 24th, 2012 Conference Call

Chesapeake Bay Program's Modeling Update

The flow of industrial waste water in the watershed model are set to zero for pass-through facilities, only the constituent loads are counted. Industrial facilities that use public supply have non-zero flows. Some of these facilities that should have had zero flows had non-zero flows in about 1/3 of the phase 5.3.2 scenarios. Due to the use of constant delivery factors rather than simulated rivers, this has no effect on loads. No scenarios will be updated unless specifically requested, but the change will be made in future scenarios. Change in flow values between scenarios should not be used.
