

Crop Nutrient Application Scenarios

Chris Brosch, DE Nutrient Management Commission

8.17.23

Today's discussions:

- AMT Tested CAST scenarios:
 - Making all manure eligible crops on manure eligible land uses 100% eligible for manure applications and remove the timing component to create a single annual average application
- Delmarva change for CAST23
 - Turned on manure eligibility for crops that had low limits (% of total need)
 - Made timing of those applications in DE match MD ES. (perhaps no effect)

Yield goal to establish nutrient need

Step 1.

- Calculate the acres of crop

Step 2.

- Separate acres into nutrient management (NM) acres and non-nutrient management acres

Step 3.

- Determine the yield for each crop

Step 4.

- Calculate the mass of nutrients required to produce the yields

Step 5.

- Determine timing and land use application eligibility

Step 6.

- Distribute biosolids then manure then inorganic fertilizer to meet crop need

Trade-offs: The Water Bed Effect

Water Bed Effect

Optimizations are not always free. Making changes to increase one thing may have negative trade-offs in other areas.

Manure source or category

BMPs impacting manure calculations

Losses of Manure Nutrients

Application of Manure Nutrients

Nutrient eligibility

- All can get nutrient application
- 11 can get manure application

Land Uses eligible to receive nutrient application

Double Cropped Land

Full Season Soybeans

Grain with Manure

Grain without Manure

Leguminous Hay

Other Agronomic Crops

Other Hay

Pasture

Silage with Manure

Silage without Manure

Small Grains and Grains

Specialty Crop High

Specialty Crop Low

Manure eligibility

- States supply these eligibility requirements
 - Even if a land use can accept manure that does not mean that it will.
 - Even if a crop is on a land use that can accept manure does not mean it does
 - Even a crop that can accept manure does not mean that 100% of it's need is manure eligible
- “disposal” manure is applied beyond the need in ~10 counties with over abundance.

- Geographic Scale and Names
- Agencies
- Delivery Factors

Detailed Crop and Turfgrass Source Data

- Double cropped crops
- Crop and load source relationship
- Plant and harvest dates
- Developed land (turfgrass) nutrient pounds per yield
- Agricultural crop nutrient pounds per yield
- Crop nutrient application by month
- Crop nutrient uptake, removal, and nitrogen fixation
- Crop cover factor
- Crop cover fraction
- Sediment tons available to erode due to plowing, by crop type

What did we
do?

Ran two versions of CAST

One with the
existing timing and
eligibility

One with UPDATED
timing and eligibility

Calculated the difference between
these two versions

(Updated version – Existing version)

What is in the versions??

Ran two versions of CAST:

Existing Version

1) An updated BMP history, including the most up to date BMP history there is so any other version will have a less recent BMP history. This a C21 based on a BMP history pulled from NEIEN after the 2022 progress submissions were completed.

2) Updated fertilizer to account for any omitted data. This is the fertilizer issue identified by the PSC where a portion of ag fertilizer was omitted in CAST 19.

3) This uses the corrected AAPFCO dataset from 1985-2016 + the state submitted data from 2017-2020 with option A used for non-submitted states

Option A is the use of state data with non-reporting states information being filled with a percentage difference based on the data from reporting states.

What is in the versions??

NOTE* Difference
between versions is in the
red box

Ran two versions of CAST:
