Title: MD DNR Continuous Water Quality Monitoring Project 2019

Geospatial_Data_Presentation_Form: Spatial dataset

Description:

Abstract:

Water quality was monitored at twenty-eight Maryland shallow water sites located in Chesapeake Bay, Chesapeake Bay tributaries and Maryland Coastal Bays tributaries during 2019. YSI (6600 V2 or EXO2) data loggers sampled seven environmental parameters: water temperature, specific conductance, dissolved oxygen concentration, oxygen percent saturation, pH, turbidity and fluorescence. Water depth was measured at stations where loggers were deployed at fixed depths. Salinity and chlorophyll were derived from specific conductance and fluorescence, respectively. Each parameter was sampled at 15-minute intervals, except at stations XEF3551 and XFG4618. The monitor at station XEF3551 and the monitor at station XFG4618 sampled parameters at 60-minute intervals for the entire deployment. The number of days that data were collected at individual stations ranged from one hundred five to three hundred sixty-five.

At eleven stations in which 6600 V2 data loggers were deployed, sondes were exchanged bi-weekly. For sixteen stations at which EXO2 data loggers were deployed, sondes were exchanged every two to four weeks because these loggers are equipped with more advanced monitoring technology that allows for longer deployments. Data loggers deployed from November through March were exchanged monthly because less biofouling, which may compromise data integrity, occurs during cold weather months. Data loggers deployed greater than 10m below the surface at station XEF3551 were exchanged monthly. Data loggers were deployed simultaneously at two depths at station XIE7136.

When data loggers were exchanged, water samples for pigments, suspended solids, and nutrients from select stations were collected for later analyses. At the same time, Secchi disk depth was measured and a Hydrolab (series 4a or 5) water quality sonde was used to collect discrete water temperature, salinity, dissolved oxygen and pH data. Light attenuation was also measured using a LI-COR instrument.

Purpose:

The Maryland Department of Natural Resources Shallow Water Monitoring program is part of a cooperative effort between the Federal government and State and local governments in the Chesapeake Bay watershed to assess the ambient water quality criteria for dissolved oxygen, chlorophyll, and water clarity in shallow water habitats. The Shallow Water Monitoring Program includes two components, the Water Quality Mapping Project and the Continuous Water Quality Monitoring Project.

Continuous Water Quality monitoring data describe the 2019 state of twenty-eight shallow water sites on Chesapeake Bay and Maryland Coastal Bays and their tributaries using key water quality indicators.

The information is integrated with data from other Bay water quality stations and living resources monitoring projects and used to understand linkages, temporal variation and long-term trends.

Water quality data are used to refine, calibrate and validate Chesapeake Bay ecological models. The models are used to develop and assess water quality criteria with the goal of removing the Chesapeake Bay and its tidal rivers from the U.S. Environmental Protection Agency 303(d) list of impaired waters.

Supplemental Information:

The target audiences for this information include Resource Managers, Technical/Scientific Users, Government, Educators, Students and General Public.

Data users who desire very detailed information about Water Quality Monitoring data definition, sampling procedures and data processing are encouraged to refer to the documents listed below.

Water Quality Database - Database Design and Data Dictionary Prepared For: U.S. Environmental Protection Agency, Region III, Chesapeake Bay Program Office, January 2004. [https://www.chesapeakebay.net/documents/3676/cbwqdb2004_rb.pdf]. An updated version of the data dictionary is a Chesapeake Bay Program work in progress.

Data_Set_Credit:

Maryland Department of Natural Resources (MDDNR) Resource Assessment Service (RAS) staff collected the majority of samples and processed the data. The Nutrient Analytical Services Laboratory (NASL) at the Chesapeake Biological Laboratory (University of Maryland Center for Environmental Science) analyzed the nutrient, chlorophyll and suspended solids samples.

The project was made possible with funding provided by The State of Maryland, the United States Environmental Protection Agency Chesapeake Bay Program, the National Oceanic and

Atmospheric Administration Chesapeake Bay Office and National Estuarine Research Reserve System program, the Dominion Foundation, the National Fish and Wildlife Foundation, the Oyster Recovery Partnership, the National Aquarium in Baltimore, The Nature Conservancy, Maryland Environmental Service, and the National Marine Sanctuary Foundation.

Data_Quality_Information:

Attribute_Accuracy:

Attribute_Accuracy_Report:

Quality Assurance/Quality Control: MDDNR followed specific procedures to ensure that the Shallow Water Quality Monitoring Program project design was properly implemented and managed with sufficient accuracy, precision and detection limits. Accuracy (closeness to the true value) of collected data was controlled and assured by the proper use, calibration and maintenance of both field and laboratory equipment for the measurement of physical and chemical parameters.

The YSI 6600 V2 sondes were configured with the following probes: 6560(conductivity/temperature); 6561(flat glass pH) or 6579(tall pH); 6136(turbidity); 6150(ROX dissolved oxygen); 6025(fluorescence/chlorophyll).

The YSI EXO2 sondes were configured with the following probes: 599870-01(conductivity/temperature) or 599827 (wiped conductivity/temperature); 599702(unguarded pH); 599101-01(turbidity); 599100-01(optical dissolved oxygen); 599103-01(total algal chlorophyll and phycoerythrin).

Resolution, range and accuracy specifications for the YSI sondes and probes may be obtained from the manufacturer. [<https://www.yisi.com/customer-support>]

In March 2015 all remaining Series 4a instruments equipped with Standard Clark Polarographic Dissolved Oxygen Sensors were replaced with Series 5 instruments equipped with optical dissolved oxygen sensors (Luminescent Dissolved Oxygen Sensor - LDO). Calibration logs for each instrument list specific replacement dates. Sensors for temperature, specific conductance, pH and depth are identical for Series 4a and 5 instruments.

Procedures used to control and assure the accuracy of field measurements consisted of calibration of field instruments, verification of calibrations, equipment maintenance, and collection of filter blanks. Details of how data acquired with YSI sondes were quality assured and quality controlled may be found in the process description elements in the Lineage portion of this metadata record.

Water quality laboratory analysis results were used to calibrate and cross-check sonde data for accuracy. Daily quality control checks (including the running of blanks and standards) were used to control and assure laboratory accuracy.

Accuracy of Chesapeake Biological Laboratory, Nutrient Analytical Services Laboratory (CBL NASL) laboratory results was also assessed through DNR's participation in the Chesapeake Bay Coordinated Split Sample Program (CSSP), a split sampling program in which

five laboratories involved in Chesapeake Bay monitoring analyze the coordinated split samples. CSSP was initiated in June 1989 to establish a measure of comparability between sampling and analytical operations for water quality monitoring throughout the Chesapeake Bay and its tributaries. DNR followed the protocols in the Chesapeake Bay Coordinated Split Sample Program Implementation Guidelines (EPA 1991) and its revisions. Split samples were collected quarterly. Results were analyzed by appropriate statistical methods to determine if results differed significantly among labs. If a difference occurred, discussions began regarding techniques and potential method changes to resolve discrepancies.

Additionally, CBL NASL participated two times per year in the United States Geologic Survey (USGS) reference sample program.

Logical Consistency Report:

Two of the attributes in the water quality data set are PARAMETER and MEASUREVALUE. In cases where PARAMETER value is "SIGMA_T" and the MEASUREVALUE in the record is a negative number, the number should be considered unreliable. SIGMA_T values are not measured. SIGMA_T values are derived.

During 2019, at all but one station, water quality monitoring sondes were deployed at a single depth. At the Aquarium East station (XIE7136) sondes were deployed concurrently at two depths: one meter from the surface and 0.3-0.4 meters above the bottom.

Values in the 'LAYER' column of sonde data files may be used to determine the depth at which a sonde was deployed. Sonde data from all 2019 sites, except XEF3551, XFG4618, and XIE7136, list a value of 'BS' ('below surface') in the LAYER column. Depth values for stations with a LAYER value of 'BS' will vary depending on the method of sonde deployment at that station. For station XIE7136, a LAYER column value of 'B' indicates the sonde was deployed 0.3 meters above the bottom and a LAYER column value of 'S' indicates the sonde was deployed 1 meter below the surface. For station XFG4618, a LAYER column value of 'S' indicates the sonde was deployed 1 meter below the surface. For station XEF3551, a LAYER column value of 'B' indicates the sonde was deployed 0.4 meters above the bottom.

Beginning in 2013, data collection was discontinued at station XIE4741 (Masonville Cove) and a new station, XIE4742 (Masonville Cove Pier), was deployed approximately 160 meters west of station XIE4741. Also, beginning in 2019, station XEF3551 (Gooses – Surface) was transitioned into NOAA's Chesapeake Bay Interpretive Buoy System (CBIBS). Data collected at that station are available through NOAA's CBIBS website [<https://buoybay.noaa.gov/>] and deployment information is no longer covered in this metadata record.

In the 2019 sonde data, there are numerous instances of turbidity measurements with negative values. The turbidity probe accuracy is plus or minus 5 Nephelometric Turbidity Units/Formazin Nephelometric Units (NTU/FNU). In cases where turbidity probe post-deployment calibration values were within acceptable limits, negative values greater than or equal to -5.0 NTU/FNU are reported.

During 2019, it was not always possible, for logistical reasons, to replace sondes at all sites every two weeks for stations: WXT0013 (Iron Pot Landing), XIE4742 (Masonville Cove Pier), XFG4618 (Harris Creek Profiler - Surface), MTI0015 (Mataponi), XKH2949 (Havre de Grace), XHF0460 (Sandy Point - South Beach), XDM4486 (Bishopville Prong), XDN6921 (Grey's Creek), NPC0012 (Newport Creek), XBM8828 (Public Landing), and XIF7918 (Riverside), or every two to four weeks for stations: XEF3551 (Gooses - Bottom), LMN0028 (Little Monie Creek), XBG4203 (Point Lookout), XBF7904 (St. Georges Creek), XCG8862 (Hoopers Island), XDF0255 (Seashore Beach), XEE3691 (Dares Beach Pier), XGF5025 (Arundel on the Bay), XDA8236 (Mallows Bay Buoy), XDG5922 (Taylor's Island Pier), XFF2293 (Tilghman Island), PXT0455 (Jug Bay), XFG2810 (Harris Creek Downstream), XFG6431 (Harris Creek Upstream), XIE7135 (Aquarium West), XIE7136 (Aquarium East – Surface and Bottom), and XJG7035 (Otter Point Creek).

The sonde at station XIE7135 was not exchanged on 8-Nov-2019.

The sonde at station XDM4486 was not exchanged on 25-Jun-2019 and 16-Oct-2019.

The sonde at station XDN6921 was not exchanged on 16-Oct-2019.

The sonde at station WXT0013 was not exchanged on 29-May-2019, 3-Jul-2019, and 22-Oct-2019.

The sonde at station LMN0028 was not exchanged on 9-Jul-2019 and 11-Sep-2019.

The sonde at station XIE4742 was not exchanged between 15-Apr-2019 and 13-Jun-2019 because the United States Fish and Wildlife Service enforced a no entry policy into areas surrounding the monitoring site due to a pair of nesting eagles. This policy precluded DNR field personnel from servicing this station. The sonde at station XIE4742 also was not exchanged on 3-Oct-2019 and 22-Oct-2019.

The sonde at station MTI0015 was not exchanged on 29-May-2019, 3-Jul-2019, and 22-Oct-2019.

The sonde at station NPC0012 was not exchanged on 16-Oct-2019.

The sonde at station XBM8828 was not exchanged on 16-Oct-2019.

The sonde at station XIF7918 was not exchanged on 18-Apr-2019, 4-Jun-2019, and 15-Oct-2019.

The sonde at station XBF7904 was not exchanged on 4-Jun-2019, 8-Jul-2019, 12-Aug-2019, and 12-Nov-2019.

The sonde at station XHF0460 was not exchanged on 10-May-2019, 20-Jun-2019, 17-Jul-2019, 28-Aug-2019, and 10-Oct-2019.

The sonde at station XKH2949 was not exchanged on 24-Apr-2019, 22-May-2019, 27-Jun-2019, 25-Jul-2019, 22-Aug-2019, 18-Sep-2019, and 15-Oct-2019.

The surface sonde at station XFG4618 was not exchanged on 2-May-2019, 23-May-2019, 4-Sep-2019, and 24-Oct-2019.

The bottom sonde at station XEF3551 was not exchanged on 8-Aug-2019 and 31-Oct-2019.

Completeness Report:

2019 Data from twenty-eight continuous monitoring stations are available on-line.
[<http://eyesonthebay.dnr.maryland.gov/contmon/ContMon.cfm>]

The 2019 Continuous Monitoring project dataset includes twelve months of sonde records from the continuous monitoring stations: WXT0013 (Iron Pot Landing), PXT0455 (Jug Bay), XIE4742 (Masonville Cove Pier), XIE7135 (Aquarium West), and XIE7136 (Aquarium East – Surface and Bottom).

Sondes were deployed eleven months at stations: XFG2810 (Harris Creek Downstream), XFG6431 (Harris Creek Upstream), XFG4618 (Harris Creek Profiler - Surface).

Sonde data were collected for ten months at station: XJG7035 (Otter Point Creek).

Nine month deployments occurred at stations: MTI0015 (Mataponi), XGF5025 (Arundel on the Bay), XEE3691 (Dares Beach Pier), XDA8236 (Mallows Bay Buoy), LMN0028 (Little Monie Creek), and XKH2949 (Havre de Grace).

Deployments at stations: XCG8862 (Hoopers Island), XBF7904 (St Georges Creek), XHF0460 (Sandy Point - South Beach), XDM4486 (Bishopville Prong), XDN6921 (Grey's Creek), NPC0012 (Newport Creek), XBM8828 (Public Landing), XIF7918 (Riverside), XBG4203 (Point Lookout), XDG5922 (Taylor's Island Pier), and XDF0255 (Seashore Beach) lasted eight months.

Sondes were deployed seven months at stations: XFF2293 (Tilghman Island) and XEF3551 (Gooses – Bottom).

In 2019, the full suite of nutrient samples were collected at stations: XFG2810 (Harris Creek Downstream) and XFG6431 (Harris Creek Upstream). A sub-set of nutrients (Volatile Suspended Solids, Ammonium, Orthophosphate, Nitrite plus Nitrate, Total Dissolved Nitrogen (TDN), and Total Dissolved Phosphorus (TDP)) were collected at stations: XJG7035 (Otter Point Creek), PXT0455 (Jug Bay), MTI0015 (Mataponi), WXT0013 (Iron Pot Landing), LMN0028 (Little Monie Creek), and XDA8236 (Mallows Bay Buoy). Alkalinity was measured at stations: XFG2810 (Harris Creek Downstream), XFG6431 (Harris Creek Upstream), and XFG4618 (Harris Creek Profiler - Surface). Total Suspended Solids, chlorophyll, and pheophytin were collected at all stations except stations XIE7135 (Aquarium West) and XIE7136 (Aquarium East - Bottom and Surface). No samples were collected by DNR at these two stations.

At stations XGF5025 (Arundel on the Bay) and XEE3691 (Dares Beach Pier), Systea “WIZ” sensors with in-situ probes to measure Nitrate and Phosphate were deployed concurrently with a YSI EXO2 sonde. Nutrient sensor data were collected every two hours in early January at both stations. These data are available through DNR’s Eyes on the Bay website: [<http://eyesonthebay.dnr.maryland.gov/contmon/nutrientsensor.cfm>].

The user may discover a few interruptions in sonde datasets. In most cases, these interruptions were related to short-term problems with sonde operation.

There were gaps in the sonde data for the following reasons.

Station XDA8236 (Mallows Bay Buoy) was not deployed until 18-Apr-2019 and was removed from service on 23-Dec-2019 due to concerns about ice and low temperature. Station XDA8236 is also missing data from 24-Jul-2019 to 7-Aug-2019 and from 31-Oct-2019 to 7-Nov-2019 due to equipment malfunctions.

Station XJG7035 (Otter Point Creek) was not deployed until 27-Mar-2019 and was removed from service on 13-Dec-2019 due to concerns about ice and low temperature. Station XJG7035 is also missing data from 13-Jun-2019 to 26-Jun-2019 due to an equipment malfunction.

Station XFG2810 (Harris Creek Downstream) was not deployed between 8-Jan-2019 and 5-Mar-2019, and was removed from service on 20-Dec-2019 due to concerns about ice and low temperatures. Station XFG2810 is also missing data from 4-Nov-2019 to 21-Nov-2019 due to an equipment malfunction.

Station XFG6431 (Harris Creek Upstream) was not deployed between 8-Jan-2019 and 5-Mar-2019, and was removed from service on 20-Dec-2019 due to concerns about ice and low temperatures. Station XFG6431 is also missing data from 30-Jul-2019 to 8-Aug-2019 due to a sonde power failure.

Station XFG4618 (Harris Creek Profiler - Surface) was not deployed between 8-Jan-2019 and 5-Mar-2019, and was removed from service on 20-Dec-2019 due to concerns about ice and low temperatures.

Station MTI0015 (Mataponi) was not deployed until 3-Apr-2019 due to concerns about ice and low temperature.

Station XEF3551 (Gooses – Bottom) was not deployed until 27-Jun-2019 due to procurement and deployment of new equipment for this station. Station XEF3551 is also missing data from 11-Jul-2019 to 3-Oct-2019 due to a sonde power failure.

Station WXT0013 (Iron Pot Landing) is missing data from 5-Feb-2019 to 6-Feb-2019 and from 6-Mar-2019 to 8-Mar-2019 due to sonde power failures.

Station XIE7136 (Aquarium East – Surface) is missing data from 3-Jan-2019 to 10-Jan-2019, 7-Mar-2019 to 4-Apr-2019, and from 6-Aug-2019 to 8-Aug-2019 due to equipment malfunctions. Station XIE7136 (Surface) is also missing data from 19-Jan-2019 to 7-Feb-2019 and from 3-Dec-2019 to 6-Dec-2019 due to sonde power failures.

Station XIE7136 (Aquarium East – Bottom) is missing data from 6-Jan-2019 to 10-Jan-2019 and from 20-Jan-2019 to 7-Feb-2019 due to equipment malfunctions.

Station XIE7135 (Aquarium West) is missing data from 15-Apr-2019 to 1-May-2019 due to sondes not being deployed during repair and replacement of deployment equipment. Station XIE7135 is also missing data from 26-Aug-2019 to 4-Sep-2019 due to an equipment malfunction.

Station XGF5025 (Arundel on the Bay) was not deployed between 3-Jan-2019 and 27-Mar-2019 due to concerns about ice and low temperature. Station XGF5025 is also missing data from 30-Mar-2019 to 9-Apr-2019 and from 8-Jun-2019 to 20-Jun-2019 due to equipment malfunctions. Lastly, station XGF5025 is also missing data from 19-Apr-2019 to 24-Apr-2019 due to a sonde power failure.

Station XFF2293 (Tilghman Island) is missing data from 7-Apr-2019 to 9-Apr-2019, 27-Apr-2019 to 7-May-2019, 2-Jun-2019 to 6-Jun-2019, and from 25-Jun-2019 to 2-Jul-2019 due to equipment malfunctions.

Station XKH2949 (Havre de Grace) is missing data from 7-Apr-2019 to 10-Apr-2019 due to an equipment malfunction. Station XKH2949 is also missing data from 13-Oct-2019 to 5-Nov-2019 due to a sonde power failure.

Station XEE3691 (Dares Beach Pier) was not deployed between 3-Jan-2019 and 27-Mar-2019 due to concerns about ice and low temperature. Station XEE3691 is also missing data from 17-Apr-2019 to 24-Apr-2019, 15-May-2019 to 21-May-2019, and from 26-Aug-2019 to 28-Aug-2019 due to sonde power failures. Lastly, station XEE3691 is missing data from 18-Jun-2019 to 2-Jul-2019 due to an equipment malfunction.

Station XBG4203 (Point Lookout) is missing data from 18-Apr-2019 to 25-Apr-2019, 1-May-2019 to 8-May-2019, 6-Sep-2019 to 11-Sep-2019, and from 8-Oct-2019 to 9-Oct-2019 due to sonde power failures.

Station XDF0255 (Seashore Beach) is missing data from 13-Jun-2019 to 18-Jun-2019 and from 10-Jul-2019 to 16-Jul-2019 due to sonde power failures.

Station XCG8862 (Hoopers Island) is missing data from 17-Aug-2019 to 27-Aug-2019 due to a sonde power failure.

Station XIE4742 (Masonville Cove Pier) is missing data from 18-Oct-2019 to 31-Oct-2019 due to a sonde power failure.

Station XHF0460 (Sandy Point - South Beach) is missing data from 24-Oct-2019 to 30-Oct-2019 and from 2-Nov-2019 to 21-Nov-2019 due to equipment malfunctions.

Station XIF7918 (Riverside) is missing data from 1-Nov-2019 to 5-Nov-2019 due to a sonde power failure.

Station NPC0012 (Newport Creek) is missing data from 19-Aug-2019 to 20-Aug-2019 due to an equipment malfunction.

Station XBM8828 (Public Landing) is missing data from 1-May-2019 to 14-May-2019 due to sondes not being deployed during repair and replacement of deployment equipment. Station XBM8828 is also missing data from 29-Oct-2019 to 6-Nov-2019 due to a sonde power failure.

On a few occasions, due to extreme low tide conditions, sondes were not submerged. These data are not included in the published dataset.

All other missing sonde attribute values were removed during the quality control process because the data were determined to be unreliable.

FIELD MEASUREMENTS AND SAMPLING

SONDES:

The continuous monitoring sensors at the sites recorded seven water quality parameters every 15 minutes, except at stations XEF3551 and XFG4618. The bottom monitor at station XEF3551 and the surface monitor at station XFG4618 sampled parameters at 60-minute intervals for all deployments. Data were uploaded to DNR's web site [<http://www.eyesonthebay.net>] shortly after retrieval.

At all sites the seven water quality parameters measured continuously were: water temperature, specific conductance (used to derive salinity values), dissolved oxygen, oxygen percent saturation, turbidity (NTU/FNU), fluorescence (used to estimate chlorophyll a), and pH. Sondes deployed at fixed depths also measured water depth.

Twelve monitoring stations were equipped with a YSI 6600 V2 sonde. These stations were: WXT0013 (Iron Pot Landing), XIE4742 (Masonville Cove Pier), XFG4618 (Harris Creek Profiler - Surface), MTI0015 (Mataponi), XKH2949 (Havre de Grace), XHF0460 (Sandy

Point - South Beach), XDM4486 (Bishopville Prong), XDN6921 (Grey's Creek), NPC0012 (Newport Creek), XBM8828 (Public Landing), XIF7918 (Riverside), and XEF3551 (Gooses - Bottom). The following sixteen stations were equipped with a YSI EXO2 sonde: LMN0028 (Little Monie Creek), XBG4203 (Point Lookout), XIE7135 (Aquarium West), XIE7136 (Aquarium East – Surface and Bottom), XBF7904 (St. George's Creek), XEE3691 (Dares Beach Pier), XGF5025 (Arundel on the Bay), XDG5922 (Taylor's Island Pier), XFF2293 (Tilghman Island), XDF0255 (Seashore Beach), XCG8862 (Hoopers Island), XDA8236 (Mallows Bay Buoy), PXT0455 (Jug Bay), XFG2810 (Harris Creek Downstream), XFG6431 (Harris Creek Upstream), and XJG7035 (Otter Point Creek). Both types of sonde logged data onto an internal memory, where it was stored until retrieval. Nine stations were equipped with cellular telemetry units, which allowed data to be transmitted hourly to a server computer at DNR. Most sondes were deployed inside vertically-oriented PVC pipes with several two-inch holes drilled along their length to allow for water exchange. Depending on location, these sondes were either suspended from a float 1.0 meters below surface or fixed 0.3 meters, 0.4 meters, or 0.5 meters above bottom resting on a stop bolt. Some EXO2 sondes were deployed inside a crabpot-like structure that rested on the bottom and suspended the instrument 0.3 meters off bottom in a horizontal PVC tube tethered to a pier with a cable.

Sondes at the following stations were deployed at a fixed depth of 0.3 meters above the bottom: LMN0028 (Little Monie Creek), MTI0015 (Mataponi), NPC0012 (Newport Creek), PXT0455 (Jug Bay), WXT0013 (Iron Pot Landing), XBM8828 (Public Landing), XDM4486 (Bishopville Prong), XDN6921 (Grey's Creek), XJG7035 (Otter Point Creek), XKH2949 (Havre de Grace), XFG2810 (Harris Creek Downstream), XFG6431 (Harris Creek Upstream), XIE7136 (Aquarium East - Bottom), XEE3691 (Dares Beach Pier), XDF0255 (Seashore Beach), XBG4203 (Point Lookout), XCG8862 (Hoopers Island), and XDG5922 (Taylor's Island Pier).

Sondes at station XEF3551 (Gooses - Bottom) were deployed at a fixed depth of 0.4 meters above the bottom. Sondes at station XBF7904 (St Georges Creek) were deployed at a fixed depth of 0.5 meters above the bottom.

All other sondes were deployed suspended from buoys or floats at a depth of 1.0 meter below the surface.

Note that sondes were deployed concurrently at two depths at station: XIE7136.

WATER QUALITY CALIBRATION SAMPLES:

Every time sondes were exchanged at each Continuous Monitoring station, "grab" water quality samples were collected at 1.0 meter depth, or at deployment depth for stations deployed at a fixed depth above the bottom, using a horizontal "Alpha" water sampler. At Station XFG4618, a second (bottom) grab sample was collected at 2.0 meter depth. At the time the water was collected, a Hydrolab sonde measurement was taken at 1.0 meter depth. Note that no samples were collected by DNR at stations XIE7135 and XIE7136.

Numbered two-quart bottles were triple-rinsed and filled with water for "whole" and "filtered" nutrient and chlorophyll samples. (As noted previously, full suites of nutrient samples were not collected at all stations).

Nutrient, pigment and suspended-solid water samples were filtered on station or shortly thereafter. Sample waters and filters were placed on ice immediately after filtration.

Particulate samples included: Chlorophyll, Particulate Carbon, Particulate Nitrogen (PN), Particulate Phosphorus (PP), Particulate Inorganic Phosphorous (PIP), Total Suspended Solids (TSS) and Volatile Suspended Solids (VSS).

Filtrate collected from TSS/VSS or PP/PIP filtrations was used for dissolved nutrient samples. Total Dissolved Nitrogen (TDN) and Total Dissolved Phosphorus (TDP), Nitrite plus Nitrate, Nitrite, Ammonium, Orthophosphate, and Dissolved Organic Carbon samples were collected.

HYDROLAB PROFILE:

The first reading of the Hydrolab water column profile at each station was recorded at the same time the water quality "grab" sample was collected. After the 1.0 meter depth record was logged, the sonde was lowered to the bottom. A reading was taken at 0.3 meters above the bottom. The sonde was raised and measurements were recorded at 0.5 meter or 1.0 meter increments until it reached the surface. (In cases where station depth was greater than 3 meters, the sonde was raised in 1 meter increments).

SECCHI DEPTH:

Secchi disk depth was measured each time sondes were exchanged. Readings with the Secchi disk were made in-situ without the aid of sunglasses. The Secchi disk was lowered into the water, on the shady side of the boat or pier. The depth at which the disk was no longer visible was recorded. The time at which the reading was taken was noted. This facilitated later matching of Secchi depth readings with transmissometer and turbidity data.

PAR MEASUREMENT:

Underwater Photosynthetically Active Radiation (PAR, 400-700nm)

When meters were exchanged at a site, down-welling light penetrating the water column (PAR) was measured underwater at several depths to calculate the light attenuation coefficient, K_d . Simultaneous surface and submersed PAR intensity measurements were taken to account for variability in incident surface irradiance due to changes in cloud cover. Data collected from this procedure were used to estimate the depth of the photic zone.

The equipment used was manufactured by LI-COR, Inc. and consisted of a LI-192SA, flat cosine Underwater Quantum Sensor, a LI-190SA air (deck) reference sensor and a Data Logger (LI-1000 or LI-1400).

Surface and underwater readings were recorded simultaneously. Readings were allowed to stabilize before being recorded. If the station depth was less than 3 meters, readings were taken at 0.1 meter and at 0.25 meter intervals until 10% of the 0.1 meter reading was reached. If the station depth was greater than 3 meters, a reading was taken at 0.1 meter and at 0.5 meter intervals until 10% of the 0.1 meter reading was reached.

PAR readings had also been collected at 15-minute intervals during deployment dates at station XBM8828 (Public Landing) between 2005 and 2012. All 2013 readings were considered invalid, however, due to equipment failure and the PAR sensor has not been deployed since 2013.

SONDE DATA CHECKS

At stations that utilized 6600 V2 data loggers, the continuous monitoring sondes were retrieved, calibrated and replaced bi-weekly during deployment. At sixteen stations, data loggers equipped with more advanced monitoring technology that allows for longer deployments were exchanged every two to four weeks. Data loggers deployed from November to March were exchanged monthly because less biofouling, which may compromise data integrity, occurs during cold weather months. Data loggers deployed greater than 10 meters below surface at station XEF3551 were exchanged monthly. At each deployment, sondes were replaced with clean, recalibrated units and data from the data loggers were downloaded to a computer.

In the field, before an instrument was replaced, field staff allowed both the new (freshly calibrated) sonde and the old (deployed) sonde to log two readings (fifteen minutes apart at most stations) side by side at the same depth. For the bottom sonde at station XEF3551 and the surface monitor at station XFG4618, only one simultaneous reading was taken using the new and old sondes. At all of the stations, for one of the simultaneous readings, data were recorded from a discrete instrument (usually a Hydrolab sonde). This three-way comparison assured that the "new" and "old" sondes were both reading each parameter within a certain tolerance. The Hydrolab reading was used as a "double-check," and since it was a discrete reading, it allowed staff to watch the display and note whether the parameters were fluctuating or stable.

EcoWatch(TM) software (a YSI product) was used to calibrate the YSI 6600 V2 instruments, as well as to upload and view data collected. KOR(TM) software (a YSI product) was used to calibrate the EXO2 instruments, as well as to upload and view data collected. Data downloaded from the sonde were subjected to quality assurance/quality control checks to ensure that values outside the range of possibility were not displayed on the DNR web site [<http://www.eyesonthebay.net>].

Data were evaluated using both three-way in-situ comparison results and data from sonde calibrations. The comparison tolerances were as follows - for both pre- and post-calibration and in-situ comparisons: Temperature (deg C) +- 0.2; Specific Conductance (uM/cm) +- 5%; Dissolved Oxygen (mg/l) +- 0.5 mg/l; pH +- 0.2; Turbidity (NTU/FNU) +- 5% or 5.0 NTU/FNU (whichever is greater); Chlorophyll (ug/l) +- 5% or 5.0 ug/l (whichever is greater).

Excessive drift between pre- and post- calibration values of sonde probes, variance from in-situ measurements or probe failures caused data to be flagged. When post-calibration drift exceeded the limits stated above in both the post-calibration and the in-situ comparables, suspect data were masked within the data set with an error code (see Quality Assurance Project Plan for list of error codes).

SONDE FILE POST-PROCESSING:

Each "raw" .csv file of sonde data was post-processed using an Excel(TM) macro. The file was opened and renamed. Rows of data acquired before and after deployment were deleted. Records (if any) were also deleted if instrument error codes indicated erroneous data. The macro rearranged columns and inserted error-tracking columns and headings. Macro statements flagged negative values, missing values and highlighted values outside each parameter's normal range. The macro also returned a report summarizing range exceedances. Event and instrument information was appended to each record.

Flagged values were evaluated. Common anomalies included spikes in fluorescence and turbidity, dips in specific conductance, and extremely high dissolved oxygen readings. Instrument post-calibration results, in-situ comparisons with Hydrolab, LI-COR readings, historical data from nearby locations, and survey crew remarks were used to determine whether sensor values were acceptable.

In cases where data were determined to be unreliable, the reason(s) were documented with error codes and comments. Unreliable data were masked. No data were discarded. Only data considered reliable were published in reports.

Field biologists and data analysts reviewed continuous monitoring data weekly. If a problem was identified, a field team member was dispatched to replace the instrument as soon as possible.

VERIFICATION AND DATA MANAGEMENT

At the end of the monitoring season, DNR data analysts and field biologists conducted additional data QA/QC procedures. All of the data were plotted and outliers and anomalous values were thoroughly researched. Staff compared unusual values to historic values from the site and values from nearby sites in the Bay. Weather events were considered, event logs were reviewed, and field staff members were consulted regarding possible legitimate causes for the values. In cases where values were not considered legitimate, error codes were assigned. All data were retained in the archive data set. After field staff and the Quality Assurance Officer reviewed error flags, the values were masked within the published dataset.

LABORATORY ANALYSIS - CBL

University of Maryland Center for Environmental Science's Chesapeake Biological Laboratory (CBL), Nutrient Analytical Services Laboratory analyzed total dissolved nitrogen, particulate nitrogen, nitrite, nitrite + nitrate, ammonium, total dissolved phosphorus, particulate phosphorus, particulate inorganic phosphorus, orthophosphate, dissolved organic carbon, particulate carbon, total suspended solids, volatile suspended solids, chlorophyll, pheophytin, and alkalinity.

Note that in 2019, the full suite of nutrients was only collected at stations: XFG2810 (Harris Creek Downstream) and XFG6431 (Harris Creek Upstream). A subset of nutrients (Volatile Suspended Solids, Ammonium, Orthophosphate, Nitrite plus Nitrate, Total Dissolved Nitrogen, and Total Dissolved Phosphorus) was collected at stations XJG7035 (Otter Point Creek), PXT0455 (Jug Bay), MTI0015 (Mataponi), WXT0013 (Iron Pot Landing), LMN0028 (Little Monie Creek), and XDA8236 (Mallows Bay Buoy). Alkalinity was collected at stations: XFG2810 (Harris Creek Downstream), XFG6431 (Harris Creek Upstream), and XFG4618 (Harris Creek Profiler - Surface). Total Suspended Solids, chlorophyll, and pheophytin were collected at all stations except stations XIE7135 (Aquarium West) and XIE7136 (Aquarium East - Bottom and Surface). No samples were collected by DNR at these two stations.

During the years 2008-2011, Shallow Water Monitoring silicate samples were collected and analyzed at four Maryland Coastal Bays stations: XDM4486 (Bishopville Prong), XDN6921 (Grey's Creek), NPC0012 (Newport Creek) and XBM8828 (Public Landing). Beginning in 2012, silicate samples were no longer collected at these four Coastal Bays stations.

Further information about laboratory analytical procedures may be obtained from the "Process_Contact".

Entity_and_Attribute_Information:

Overview_Description:

Entity_and_Attribute_Overview:

This metadata record is a description of a continuous monitoring project. Project data are an aggregation of data collected at twenty-eight Maryland stations during 2019.

The data are contained in six related entities (tables): Station_Information, Monitoring_Event_Data, Water_Quality_Data, Light_Attenuation_Data, Optical_Density_Data, and CMON_DATA. Each table contains attributes (fields).

The entity Station_Information is comprised of the attributes: Station, StationDescription, CBSeg2003, CBSeg2003Description, CBSegmentShed2009, CBSegmentShed2009Description, HUC8, HUC12, FIPS, State, CountyCity, USGSGage, FallLine, Latitude, Longitude, UTMX, UTMY and LLDatum.

The entity *Monitoring_Event_Data* is comprised of the attributes: *MonitoringStation*, *EventId*, *Cruise*, *Program*, *Project*, *Agency*, *Source*, *Station*, *SampleDate*, *SampleTime*, *TotalDepth*, *UpperPycnocline*, *LowerPycnocline*, *FieldActivityEventType*, *FieldActivityRemark*, *WindSpeed*, *WindDirection*, *PrecipType*, *TideStage*, *WaveHeight*, *CloudCover*, *Pressure*, *GaugeHeight*, *FlowStage*, *Details*, *Latitude*, and *Longitude*.

The entity *Water_Quality_Data* is comprised of the attributes: *MonitoringStation*, *EventId*, *Cruise*, *Program*, *Project*, *Agency*, *Source*, *Station*, *SampleDate*, *SampleTime*, *TotalDepth*, *UpperPycnocline*, *LowerPycnocline*, *Depth*, *Layer*, *SampleType*, *SampleReplicateType*, *Parameter*, *Qualifier*, *MeasureValue*, *Unit*, *Method*, *Lab*, *Problem*, *PrecisionPC*, *BiasPC*, *Details*, *Latitude*, and *Longitude*.

The entity *Light_Attenuation_Data* is comprised of the attributes: *MonitoringStation*, *EventId*, *Cruise*, *Program*, *Project*, *Agency*, *Source*, *Station*, *SampleDate*, *SampleTime*, *TotalDepth*, *UpperPycnocline*, *LowerPycnocline*, *Depth*, *Layer*, *SampleType*, *SampleReplicateType*, *Parameter*, *Qualifier*, *MeasureValue*, *Unit*, *Method*, *Lab*, *Problem*, *PrecisionPC*, *BiasPC*, *Details*, *Latitude*, and *Longitude*.

The entity *Optical_Density_Data* is comprised of the attributes: *MonitoringStation*, *EventId*, *Cruise*, *Program*, *Project*, *Agency*, *Source*, *Station*, *SampleDate*, *SampleTime*, *TotalDepth*, *UpperPycnocline*, *LowerPycnocline*, *Depth*, *Layer*, *SampleType*, *SampleReplicateType*, *Parameter*, *Qualifier*, *MeasureValue*, *Unit*, *Method*, *Lab*, *Problem*, *PrecisionPC*, *BiasPC*, *Details*, *Latitude*, and *Longitude*.

The entity *CMON_DATA* is comprised of the attributes: *Station*, *StationDesc*, *Sample_Date*, *Sample_Time_EST*, *Layer*, *Depth_m*, *Salinity_ppt*, *Temp_C*, *DO_mg/L*, *DO_%Sat*, *pH*, *Turbidity_NTU/FNU*, and *Chl_ug/L*.
