# BEYOND 2025: SHALLOW WATER HABITATS SMALL GROUP Listening Session

January 8, 2024

BREAKOUT GROUP: 2 of 3

FACILITATOR: Brooke Landry

#### QUESTION 1: What do healthy and sustainable shallow water habitats look like to you?

dynamic, connected areas that can respond to transgression, SLR, storms, freshwater changes by transitioning into natural roles of ecosystem services

Resiliency to increased load and flow scenarios Densely vegetated, with buildings behind vegetation and far enough from the water to accommodate shoreline changes

very low slope, high hydrologic connectivity between open water and land indigenous vegetation with low evidence of non-natives or invasives absence of litter, plastics, styrofoam, other human waste, post consumables.... and a clear water column.... you can see your toes once in the water unless native SAVs obscure areas are accessible to the public Place where people can fish and people/pets can swim

Shallow water habitats and landscapes upstream of them are conserved and permanently protected.

Ones in which the shallow water habitats and their riparian buffers are managed and REGULATED as a single, integrated ecosystem. (In VA they are reg separate

Resilient--able to respond to disturbance, reorganize, and undergo change while maintain ecosystem functioning and productivity (ecosystem services)

Water connected to watershed conditions, including vegetation, impervious surfaces, living organisms Waters that are used and valued by communities. This may be an informal impression or some sort of social science construct. Not just a physical/ecological thing.

It looks like it is free of pollution and invasive species. It also is available to the community to use as intended or enjoy. Dominated by native species and communities, with water quality parameters sufficient to support them. Some may not be self-sustaining-need ongoing management

Supportive of native wildlife, fisheries and other designated uses, resilient to climate change and disturbance, connected to other waterways

Resilient and connected systems that integrate aquatic and terrestrial near-water habitats that can adapt and change while maintaining key ecological functions.

clear water protected riparian areas with a strong ground water/surface water interface to maintain temps and clarity, and upstream sources of pollution mitigated

specimen/champion trees along edges, riparian zone High productivity waterbody edges that sustain thriving resources across all uses and impacts. Nontidal Headwater Streams- Intact Riparian Buffer, Livestock excluded, limited impervious surface and stormwater runoff, Hyporheic exchange Dynamic suite of riparian veg (emergent), submersed veg, diverse 3-D structure (wood, rock, etc), transitioning to deep water

Healthy and sustainable even after factoring in population growth, economic development, and climate change. It takes work to tread water

natural, free flowing waters (steady flow)

No fishkills/ low DO events

No nuisance macroalgae blooms; healthy benthic algae (diatoms not toxic cyanobacteria) Provide conditions that support/maintain living resource productivity such as egg/larval survival of fishes clear water, can see benthos Full trophic web in abundance including top predators Management
(restoration and
conservation) to
restore ecological
function to benefit
fish, wildlife and
people. Not
pre-settlement, but
ecol. function.

clean water with abundant native wildlife and ability for sustainable fishing and recreational opportunities for all.

Biodiverse, resilient, productive Healthy waters, habitats full of life and grass, biodiverse

## QUESTION 2: Where should focus be given to maintain or improve shallow water habitats?

For example, this could be geographic focus, modeling focus, people focus.

engagement regarding land use planning

Enhanced // monitoring to understand where change is occurring and why.

#### TOXIC **ALGAE**

storm water Accounting for growth- according to the Chesapeake Bay Program, the watershed still loses about 70 acres of forest a day. The majority of this loss is due to development.

Attention to protections that are sustainable in a changing climate

focus should be made toward restoring HQ and EV impairments to agriculture by restoring and protecting riparian areas (livestock exclusion fencing) and ensuring cropland BMPs are implemented

hydrologic ... connectivity between shallow/open water and land.

wetlands restoration, creation and protection needs to be part of urban landscapes. Maybe a priority due to cost and complexity.

Maintain recreation uses (fishing, swimming, pets)

Enforce net gains in riparian and tree canopy coverage at the county level.

The permanent protection of the shallow habitats, as well as land upstream of these habitats, should be foundational.

Use targeted approach that incorporates areas that will have the greatest env. outcomes and local landowner concerns/interests Modeling: must account for benthic primary production (not just SAV) in healthy shallow water

Development of metrics of success, and monitoring to show whether actions are leading to achievement of goals.

Tidal and nontidal adjacent wetlands restoration and creation

conserve marsh V migration corridors

onto private shorelines dark false mussels linked to dog illnesses/ deaths

There will be areas that will be shallow water habitats that are not habitats now. Can we help owners protect them or buy them out when equitable and start preparing areas?

Brook trout habitat. If it's intrinsically

Permanent land protection and landscape scale conservation should be foundational to the Bay Program's efforts

I spoke with VA CZM about combining the CBPA and Tidal Wetlands regulations to integrate regulation and manage across the continuum

focus on how SW habitats will shift in area and location under future conditions of SLR. especially when ecosystems transform (e.g. tidal fresh to saline)

projects with co-benefits for ecosystem services and meeting the shared goals of multiple parties

Really need to push for urban hardened shorelines as priority areas for diversification of shallow water habitat

the landscape.

hubs and corridors of protected areas in a landscape across

needs to be addressed. Shallow water (streams) cross so many private properties. Streamline permitting, working with property owners

Private property

Geographic, along flow paths feeding shallow water, and People, to support and adopt practices

important to maintain the eastern brook trout despite climate change, we need to protect now all areas that can survive climate change

Headwater

streams,  $\checkmark$ 

cold water

habitat (i.e.

brook trout)

particularly /

Nutrient ratios are important in

determining what

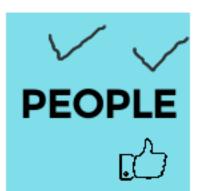

type of primary

present. Impacts

whole food web

producers are

reduce loading from septics

Improving understanding of living resource responses to habitat and WQ

> how can Al be used as a tool to support all over the ideas expressed

All habitat types are worthy of focus. High quality systems for habitat should have protective/enhancem ent focus, as well as those that can be improved for living resources.

Programs and process that enable adaptation. Regulatory systems are not adaptive

People focused, allow for place-based difference in emphasis.

permanent protection of riparian buffers \

restoration of riparian buffers

QUESTION 2 OF 6

### QUESTION 3: How would you go about getting to your vision of healthy and sustainable shallow water habitats? You can't do everything so think about the top two things you

would focus on?

fund maintenance and adaptive management efforts

require the

beneficial use of dredge material for use in thin layer

placement when

of a valuable

resource

feasible? No waste

landscape protection

> Balanced nutrient reductions!

State/watershed riparian buffer and cattle exclusion laws. Partnerships with local iurisdictions to scale up headwater restoration.

> synthesize current efforts to understand future location and conditions of SW habitats, identify gaps, priority ecosystem transformations

Permanent conservation/

Need to engage the community at the neighborhood level. How? We need significant simplification of federal grant program application and administration.

ensure restoration projects are properly maintained over the long-term

fund restoration projects on private property

projects

map out impairments that involve agriculture in EV and HQ watersheds then focus on saturating these watersheds with BMPs to restore riparian health while controlling runoff and keeping soil on farm

governance systems

Rethink "monitoring" in shallow waters to improve our understanding of changes and to improve Lew's models

fund long-term monitoring efforts

Better monitoring of macroalgae and benthic algae.

Develop crediting protocol to drive market forces to increase broader funding for shallow water habitat

Improve outreach and education with private landowners about--and financial incentives for--natural shorelines.

We need to establish a basis for crediting shallow water habitat to use market processes to advance goals of shallow water habitat

DOD

lands for

that allow for/ enable shifting shores and changes in shallow water systems

Fee simple and easements for tidal marsh retreat.

Wetlands specific funding. Separate from other Nature based solutions.

replacing armored shorelines with living and natural shorelines, and reducing sources of sediment

states to focus on whole system shallow-water restoration and protection to be able to implement locally-led strategies and leverage federal \$

Build capacity in

Educating communities on its importance. restoration and protection efforts and how they too can get involved.

Inoculate all tidal marsh restoration projects with ribbed mussels for erosion resistance and improved water quality

Programmatic support-crediting, funding, regulation for projects which will maintain or improve shallow water habitats, disincentives for projects which fail to do this

Better development best management practices (that are enforced)!

Enhance targeting to connect between outcomes, such that multiple outcomes are met with individual conservation and restoration efforts.

Community-led watershed planning for conservation and restoration. designed to meet community and local economic needs as well as environmental goals

+ Utilize local knowledge to inform decision making and co-development of adaptation strategies

TMDL "credits" also need to incorporate local stream/water health, not just delivery to Bay mainstem

Change the TMDLmove it to EPA R3 in Philadelphia and include a temperature TMDL in headwaters

Streamlining existing conservation funding to provide flexible and holistic funding to restore/ protect entire systems.

Brook Trout WG's plan to work with local government to protect habitat is good-expand the pilot in MD and PA as quickly as possible, race against the clock w/climate change

Baywide plastic bag/straw/etc. ban

## QUESTION 4: What sort of public or community engagement strategies would be most successful for connecting the public to shallow water habitats?

Focus on equity and communities of color.

recognize communities who rely on fishing for food

The other 4 steering committee small groups could consider a similar meeting as this one Through State Park and county park access areas BMP "fact sheets" plain language
documents
explaining different
BMPs, why, how,
etc. to combat
misinformation (Ex:
Stream restoration)

Coordinate with groups that plan community events

Make it

easy to

read.

Work with schools and the Chesapeake Bay units they study

Paired technical and

financial assistance,

with field tours and

time around it.

Develop literacy programs for adults, not just school kids. CBF's VOICES program is a good model. Expand that throughout the Bay!

Highlight the value of healthy shallow waters to recreational anglers

Include markets for WQ, carbon, other nature based solutions services

Work with ecumenical faith based organizations

Links to drinking water/ mailings via drinking water or sewar bills Town Halls,
Community
Collaboration Events,
Imbedding
Community Captains
in Orgs to ensure the
community stays
abreast of updated
information & efforts.

Use of Hedonic

Pricing Indexes -

private lands with

trees and wetlands

are worth more - to

show the economic

incentive to

landowners.

Make shallow water habitats cool (no pun intended). I.e., use social media and tie in shallow water with something more universally relatable

use existing networks

Offer incentive for volunteer opportunities out on the water. People feel more connected to the problem if they spend more

community stipends
where needed for
understanding and
active participation

Look into working
with recreation
organizations / loo
businesses that us

organizations / local businesses that use shallow water habitats (SUP, fishing charters, etc) to provide educational components

Work with aquaculturist

Simplify federal grant application and admin procedures.

provide groups/people a grant writer! :) link reductions of plastics/trash/solid waste to tax benefits for local communities/citizens. Landowner incentive programs (taxes, payments etc...), highlighting landowners who are being good stewards of their property.

use marketing & advertising principles

Monitoring
Cooperative,
Waterkeepers,
Watershed Stewards
Alliance, other local
nonprofits

- Chesapeake

QUESTION 4 OF 6

# QUESTION 5: How can the bay program add value to new or ongoing work in shallow water habitats? (Examples could include coordination, policy, science support)

Science Help:
Monitoring toxic
benthic algal mats
and understanding of
toxin fate and
transport.
Cyanotoxins
(microcystin, saxitoxin
and anatoxin) docume

Incorporate a revised plan for shallow water quality monitoring, while the States' monitoring infrastructure is still intact after 20 years of Round 1 of monitoring throughout the Bay.

STAC reports providing justification

Trusted source of science

focus on restoring sub-watersheds with local impairments rather than general load reductions to the Bay that do not restore local waters

Connect the terrestrial/freshwater/ estuary divide among organizations

Pet and human health language really does matter. how shallow waters is defined, how it's different/or the same/ from riparian complexes (e.g. stream-floodplain-wet land)

Technical
Assistance
(e.g. for grant
applications
for small orgs)

funding for permanent landscape conservation

Policy- governance systems to allow/ enable shifting shores and shallow water systems

Space for keeping

different programs

are working towards

cross-cutting goals

track of how the

Update resource management with more updated science focusing on historic changes (much greater proportion of shallow water habitat today as result of our shoreline development)

More interactions with community.

Routine monitoring of benthic algae and macrolage / To be more effective leaders, the bay program agencies could work to build more trust with each other. The different agencies are partners not adversaries

Communications useful for local jurisdictions and communities to illustrate issues and options for conservation and restoration

Longer term monitoring and adaptive management

seafood)

Transport of freshwater toxins downstream (and into

encourage better collaboration and working beyond 1 practice - i.e. wetlands and buffers - to focus on restoring systems.

Streamline workgroups to

Academy for practitioners, permitters, and homeowners

Funding to states to add capacity

Co-benefit economic analyses

rspersion of shallow water

unding o states to add apacity Connect outcomes to reflect that this is an ecosystem, not simply separate outcomes.
Especially so in the shallow waters and edges

Revise crediting and accountability to allow for actual habitat improvements rather than only nutrients and sediment.

QUESTION 6: Are there any other considerations for the Shallow Water Habitat Small Group as we move through our work?

The total acreage of wetlands is decreasing. We need plans that integrate and fund permanent conservation

Managed and REGULATE shallow waters as a single, integrated ecosystem. In VA, they are regulated as spearate entities. The EC needs to be more accountable for progress

Each state needs to have lead staff for each goal and have them accountable for making progress.

Working with breweries, wineries and distilleries

Wetland goal originally only to off-set historic loss. Need to look forward to anticipated areal extent and geographies for future wetlands

Make it easy to read.

Interpretive Dance Remember why we do what we do.

Drones (but seriously, cool tech will bring in people) carbon
sequestration!
Preserve
existing and
expand
capacity
