Description:

Abstract:

The overall phytoplankton monitoring program is designed to detect and monitor changes in plankton production in relation to changing water quality conditions in Chesapeake Bay. Phytoplankton are the dominant producers in the Chesapeake Bay and are the base of the food chain for many higher tropic levels. Excessive blooms of plankton species are considered evidence of eutrophication in the bay and are known to degrade water quality and block light from submerged aquatic vegetation. Sampling is performed in conjunction with the Virginia phytoplankton, fluorometry, mesozooplankton, microzooplankton, jellyfish and water quality monitoring programs. Carbon fixation rates (C14) were obtained from replicate surface layer composite samples at 15 stations, sampled monthly from January - December in Virginia. Stations were located to characterize primary productivity in the lower Bay and Bay mouth systems, Virginia Tributaries and Southern Branch of the Elizabeth River. Sampling in the Elizabeth River did not begin until February of 1991. In 1998, sampling at Elizabeth River Station SBE2 was Discontinued and a second sampling cruise was added in July and August for all remaining station.

#### Purpose:

The state of Virginia, in cooperation with the US EPA Chesapeake Bay Program, has monitored phytoplankton primary production in the Virginia mainstem and tributaries since January 1989. The program is designed to give comprehensive spatial and temporal information on primary production. Sampling is performed in conjunction with the Maryland phytoplankton, fluorometry, mesozooplankton, microzooplankton, jellyfish and water quality monitoring programs.

Supplemental Information:

**#STATION NAMES AND DESCRIPTIONS** 

LE5.5-Mouth of James River/Bay transition VIMS Historical Station (JA0.0) Slack Water Station

CB7.4-Baltimore Channel at Bay Bridge - Bay/Ocean transition area at mid-Bay mouth channel

CB7.-3E Lower Eastern Shore Channel area

CB6.4-Central Bay Stem offshore from the York River mouth

LE3.6-Mouth Rappahannock River/Bay Transition (VIMS Hist. Sta. - RAO.O)

CB6.1-Lower end of Main Bay Channel - Anoxia Monitoring

WE4.2-Mouth of York River/Bay Transition Area (VIMS Hist. Sta.- YKO.O)

SBE2-Southern Branch of the Elizabeth River - Adjacent to Atlantic Wood

SBE5-Southern Branch of the Elizabeth River - Adjacent to Virginia Power

TF3.3-N40, Clay Bank, Rappahannock River

RET3.1 -N. Buoy R10, VIMS Slack Water Station, Rappahannock River

RET4.3 -VIMS Historic Station C57, York River

TF5.5 -Red buoy 107 JRWQMP Station #13, James River

RET5.2 -Swann's Point JRWQMP STA. #19, VIMS Slack Water Station, James River

TF4.2 -White House, York River

Data\_Quality\_Information:

Attribute\_Accuracy:

Attribute\_Accuracy\_Report:

The phytoplankton field chief was the custodian for all samples collected, and verifies proper labeling of bottles, complete field data entries, the collection of the samples, preservative used and transport to the laboratory. He also supervised the calibration and availability of field equipment. Samples were turned over to the laboratory chief who oversees the sample processing, analysis and recording of the raw data. Chemical analysis, raw data sheets and other stages of the collection and analysis procedures are routinely checked by the principal investigator and laboratory chief for quality assurance.

Logical\_Consistency\_Report:

Not Applicable

Completeness\_Report:

Standard protocol procedures will be followed to guard against errors and maintain accuracy and precision thought out the collection and analysis procedures (Strickland and Parsons, 1972). These include first hand instruction to all assistants by the re-check and first hand observations by the PI., and periodic duplicate analysis of samples collected. The C14 work will be performed on four separate replicates taken from each composite sample. Carbonate alkalinity will be determined on four separate replicates. Comparison between replicates will be constantly monitored.

Positional Accuracy:

*Horizontal\_Positional\_Accuracy:* 

Horizontal\_Positional\_Accuracy\_Report:

Station positions in data set are approximations of actual positions in the field. Station latitudes and longitudes are input into a Loran-C or GPS receiver and sampling begins when boat reaches preprogrammed coordinates. Loran-C is accurate to +/- 1500 ft. The actual Loran/ GPS coordinates for each sampling event are not currently recorded in data set.

*Vertical\_Positional\_Accuracy:* 

*Vertical\_Positional\_Accuracy\_Report:* 

Water column conductivity is recorded immediately before plankton sampling. P\_Depth is set at 0.5 meters above the Pycnocline and is used at the cutoff depth between upper and lower water column composite samples. If a station has no pycnocline then the is divided into thirds by depth and the top third of the water column is treated as the upper water column. The pycnocline is determined as follows: ((Bottom Conductivity-Surface Conductivity) / Bottomdepth)\*2= Threshold If Threshold is less than 500 then Station has no Pycnocline. If Threshold is greater than 500, then the pycnocline is the first depth at which the conductivity change is greater than the threshold value. Units of measurement: Conductivity -uhhos/cm Depth- meters

Process\_Description:

-Chesapeake Bay Program Laboratory Method Code PD102

Water sub-samples for the productivity measurements were taken from each of the two composite water samples taken from above the pycnocline at each station. Two one-liter water samples were taken from each of the two composite sample carboys (a total of four samples per station). Samples were placed in labeled bottles and placed in a cooler and transported back to the laboratory for analysis. Productivity analysis was performed immediately upon returning to the laboratory.

In the laboratory, a one hundred milliliter samples from each composite sample were placed in separate dilution bottles and transferred to a water bath equipped with a bottle holder, which rotates between banks of cool-white fluorescent lights. The light levels exceeded the light saturation point of the phytoplankton. The temperature of the water bath was the same as the temperature at each station when the samples were taken. After one hour of acclamation the bottles were inoculated with two to five uCi C14-NaHCO3. The samples were returned to the water bath for one hour. One of the samples was analyzed for C14 activity immediately (zero Time of Sample). At the end of the incubation period (one and half to two hours) the remaining samples was filtered through a 25 mm 0.45 pore-size millipore filter under a vacuum less than 5 cm Hg pressure. After the contents of the milk dilution bottle and its rinses were filtered, the Millipore filters were removed and fumed over concentrated HCl for 30 seconds and placed in scintillation vials. Scintillation fluid was added to each vial and C14 activity was determined using a Beckman Model LS 1701 scintillation counter. The amount of C14 in the stock bottle was determined by placing 20 to 50 micro liter of stock solution in scintillation vials containing 0.5 milliliters of phenethylamine. Scintillation fluid was added to the vials set in the dark over night and analyzed for C14 activity.

Chlorophyll A is determined from grab samples for chlorophyll determination are filtered through Whatman GF/F filters. Filters are placed in 90% aqueous acetone and ground to a uniform consistency with a tissue grinder. Samples are steeped overnight at 4 degrees C in the dark. The extract is clarified by centrifugation. Spectrophotometric readings are taken at 750, 664, 647, and 630 nm. The sample is acidified by placing 2 drops of 1 N HCl into the extract and read at 750 and 665 nm.

Total alkalinity is calculated in the following manner: Initial pH is determined. Then 0.025N HCl is add in 0.2-milliliter aliquots until pH is 3.8-4.2. There after pH is recorded for five cumulative additions of 0.025N HCl.

#### # FORMULAS, CALCULATIONS, AND CONVERSIONS

>Calculation of Carbon Fixation

The following equations were used to determine the rate of carbon fixation in ug/l/hr. Note that the raw data used in these calculations are not presented in the associated data set. Only the resulting carbon fixation rate is included.

DPMSP = Total disintegrations per minute for C-14 spike

BTIME = Beginning time of incubation (h) ETIME = Ending time of incubation (h)

CARBALK = Total inorganic carbonate

>Calculation of Assimilation Ratio

```
ASMRATIO = CARBFIX / CHLA - this ratio is calculated prior to rounding the CARBFIX value
where ASMRATIO = Assimilation ratio
CARBFIX = Carbon fixation in ug C/l/h from 2
CHLA = Chlorophyll a in ug/l
ss Date: ongoing

Overview\_Description:

Entity\_and\_Attribute\_Overview:

All data

*Entity\_and\_Attribute\_Detail\_Citation:* 

8/01/96- Multiple sampling date discrepancies were found between the phytoplankton, zooplankton and production data, which were collected synchronously. Often the date of sample processing was placed on the sample and not the actual field collection date. Sampling event dates should be identical for phytoplankton and primary production. Note that zooplankton and phytoplankton data will have differing field dates because they are collected on separate sampling trips in the tributaries. Dates were corrected based on the original field sheets. Corrected data sets will have an R\_DATE of 07/01/96 or later.

8/31/95- CRUISE NUMBERS - BAY012 - BAY211 were supplied by the Chesapeake Bay Program office. See Guide to Living Resource Data Sets for complete list of Bay Cruise periods.

8/31/95- G\_METHOD was changed to 7- refers to Table 17, PAGE F-9 APPENDIX F, of the Living Resources Data management plan, 1989. This is a change in reporting of GMETHOD in previous versions of the data set, not a change in collection method

8/31/95- REP\_NUM - NOTE: The sampling scheme for sample collection differ from those in the MARYLAND PRODUCTION DATA SET. The data values are comparable but the VIRGINIA sampling scheme takes two field replicates compared to the Maryland one field replicate. In order to accommodate this in the data sets all Virginia samples have had the replicate numbers reassigned as follows:

Virginia	Vi	rginia	
Field Rep	licate Lab	Replicate	REP_NUM
1	1	1	
1	2	2	
2	1	3	
2	2	4	

01/01/98- SER\_NUM, MAX\_DEPTH- Prior to 1997, these data field were unavailable for VIRGINIA data. CHLA and ASMRATIO were not always collected at time of C14 sampling prior to 1996. SER\_NUM is not available because Virginia does use a serial number system to track samples.

SUMMER 1997 - The Living Resources Data manager supplied salinity zones to the plankton data based on salinity data collected by the Virginia Water Quality Monitoring Program. Values were derived from Water Quality Hydrographic data collected concurrently with the mesozooplankton. If data was not available for the of sampling but was collected within a one week window of sampling date, the water quality data was used to determine a salinity zone. However the salinity zone is marked with an E to denote being estimated.

02/01/98- The salinity zones appearing in the 1999 data are provisional. They have not yet been checked against the water quality data for validation. The 1999 Virginia Tributary water quality data will not be delivered to the CBPO until June 2000. After

delivery of the water quality data, salinity zones will be confirmed.

01/01/2000- All Latitudes and Longitudes converted to NAD83 coordinates.

Summer 2003- It was determined Maryland and Virginia production measurements, should analyzed separately due shipboard methodology differences. The current Maryland protocol holds productivity samples at near-ambient temperatures and shipboard light conditions for 0.5 - 6 hours. Thus samples able to begin acclimating to relatively high light levels on shipboard and samples may experience above-ambient temperatures before they are placed in light-saturated, temperature-controlled incubation chambers in the laboratory. The current Virginia protocol maintains productivity samples in a closed cooler on ice prior to being sent to the laboratory for analysis. Virginia's samples experience below-ambient temperatures in all seasons but winter, and are acclimated to low light when they are placed in the incubation chambers.

Winter 2002- For extensive details in regards to quality assurance issues and data comparability issues between Maryland and Virginia Programs please see the CBP Phytoplankton Split sample portion of the Chesapeake Bay Quality Assurance Program at:

http://www.chesapeakebay.net/qualityassurance.htm

April 2004- Chlorophylls for the river stations was not performed. Sept. 2003 LE 3.6 and CB 6.1, July 2003 RET 3.1,TF 3.3, TF5.5 were not taken. The tributary stations are no longer collected during November or December.

08/11/2005. Note due to contract changes starting in January 1996, station LE5.5 had a coordinate change. This station move was not documented until August 2005. Due to this station relocation, all data collected at the altered location had the station name changed to LE5.5-W in August 2005.
